Manufacturer Product Number:

DS1099U-WT+T

Series:

EconOscillator™

DiGi-Electronics Programmable:

Not Verified

PLL:

No

Output:

CMOS, TTL

Ratio - Input:Output:

1:2

Frequency - Max:

2Hz, 8Hz

Voltage - Supply:

2.7V ~ 5.5V

Mounting Type:

Surface Mount

Supplier Device Package:

8-uMAX/uSOP

Manufacturer:

Analog Devices Inc./Maxim Integrated

Product Status:

Active

Type:

Clock Generator

Input:

Clock

Number of Circuits:

1

Differential - Input:Output:

No/No

Divider/Multiplier:

Yes/No

Operating Temperature:

-40°C ~ 125°C

Package / Case:

8-TSSOP, 8-MSOP (0.118", 3.00mm Width)

Base Product Number:

DS1099

Environmental & Export classification

RoHS Status:

ROHS3 Compliant

REACH Status:

REACH Unaffected

DS1099

Low-Frequency Dual EconOscillator

General Description

The DS1099 is a low-cost, low-power, low-frequency silicon oscillator that generates two square-wave outputs with frequencies between 0.25Hz and 1.048MHz. Individual output enables allow both outputs to be enabled/disabled independently. Both outputs are capable of sinking 16mA, allowing them to directly interface to light-emitting diodes (LEDs) as well as other external circuitry. The DS1099 operates over a wide supply voltage, making it suitable for both 3V and 5V systems. The device is shipped from the factory custom programmed and calibrated, ready to be inserted into the end application.

Contact the factory for custom frequencies or requirements.

Applications

- Flashing LED Status Indicators
- Consumer Appliances
- Servers
- Printers
- Switch-Mode Power Supplies

Features

- Low-Cost, Low-Frequency EconOscillator™ with Dual Outputs
- Factory Programmed
- Output Frequencies Independently Programmable from 0.25Hz to 1.048MHz
- 2.7V to 5.5V Single-Supply Operation
- No External Timing Components Required
- Independent Output Enables
- CMOS/TTL-Compatible Outputs
- Oscillator Outputs Capable of Sinking 16mA to Directly Drive LEDs
- Relieves Microprocessor of Periodic Interrupt
- Low-Power Consumption
- Operating Temperature Range: -40°C to +125°C
- ±100ppm/°C Temp Drift (max)

Absolute Maximum Ratings

Voltage Range on V_{CC} Relative to Ground -0.5V to +6.0V
 Voltage Range on $\overline{OE0}$ and $\overline{OE1}$
 Relative to Ground -0.5V to ($V_{CC} + 0.5V$),
 not to exceed 6.0V

Operating Temperature Range -40°C to +125°C
 Storage Temperature Range -55°C to +125°C
 Soldering Temperature See IPC/JEDEC
 J-STD-020A Specification

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Output Rise/Fall Time	t_R , t_F	$C_L = 15pF$ (both)			20	ns

Note 1: All voltages referenced to ground.

Note 2: Active supply current combines the standby current with the output current. The output current is defined by $I = (C_{LOAD} + 12pF) \times V_{CC} \times f_{OUT}$ for each output when enabled.

Note 3: This is the change observed in output frequency due to changes in temperature or voltage.

Note 4: This parameter is guaranteed by design.

Note 5: This indicates the time between power-up and the outputs becoming active.

Functional Diagram

Detailed Description

The DS1099 consists of a fixed-frequency 1.048MHz master oscillator followed by two independent factory-programmable dividers. The two divider outputs are connected to pins OUT0 and OUT1, which are

Table 1. Divider Settings and Output Frequencies

DIVIDER SETTING X_0 OR X_1	DIVISOR	f_{OUT0} OR f_{OUT1}
0	1	1.048MHz
1	2	0.524MHz
2	4	0.262MHz
3	8	0.131MHz
4	16	65.50kHz
5	32	32.75kHz
—	—	—
19	524,288	2Hz
20	1,048,576	1Hz
21	2,097,152	0.5Hz
22	4,194,304	0.25Hz

independently enabled/disabled using the output-enable pins, $\overline{OE0}$ and $\overline{OE1}$, respectively. When the output-enable pins are active (low), the corresponding outputs are enabled. If either output-enable pin is tied to its inactive state (high), then the corresponding output is disabled and forced high immediately. The output-enable pins only disable the corresponding output driver(s) and do not shut down the master oscillator or the dividers.

Since the master oscillator frequency, f_{MOSC} , is fixed, the frequency of OUT0 and OUT1 is determined by DIVIDER 0 and DIVIDER 1, respectively. And since each output has its own divider, f_{OUT0} and f_{OUT1} can be programmed independent of each other.

The frequency of the outputs are calculated as follows:

$$f_{OUT0} = f_{MOSC}/2^{X0} = 1.048\text{MHz}/2^{X0}$$

$$f_{OUT1} = f_{MOSC}/2^{X1} = 1.048\text{MHz}/2^{X1}$$

where X_0 is the DIVIDER 0 setting and X_1 is the DIVIDER 1 setting. Valid values for X_0 and X_1 are integers 0 to 22 (dec).

Table 1 shows output frequencies and divider values for the range of divider settings.

DS1099

Low-Frequency Dual EconOscillator

The divider settings, X_0 and X_1 , are factory programmed. When placing an order for the DS1099, it is required to specify X_0 and X_1 . If only one output is used, it is recommended that the unused output be disabled.

The oscillator outputs are asynchronous. Since the master oscillator and dividers are free running, even when both outputs are disabled, the state of the output when \overline{OE} becomes active is unknown for up to half an f_{OUT} period. When \overline{OE} is brought low, the output is enabled instantaneously. Likewise, if the output is disabled while outputting the low half of a cycle, the output instantaneously is forced high before the current cycle is completed.

Branding Information

The package branding includes a0 and a1 on the top of the package next to or below 1099.

Applications Information

Power-Supply Decoupling

To achieve best results, it is highly recommended that a decoupling capacitor is used on the IC power-supply pins. Typical values of decoupling capacitors are 0.01 μ F and 0.1 μ F. Use a high-quality, ceramic, surface-mount capacitor, and mount it as close as possible to the V_{CC} and GND pins of the IC to minimize lead inductance.
