Purchase and inquiry

Manufacturer Product Number:

MAX136CPL

Series:

-

Voltage - Supply:

9V

Mounting Type:

Through Hole

Supplier Device Package:

40-PDIP

Manufacturer:

Analog Devices Inc./Maxim Integrated

Product Status:

Obsolete

Operating Temperature:

0°C ~ 70°C

Package / Case:

40-DIP (0.600", 15.24mm)

Base Product Number:

MAX136

Environmental & Export classification

RoHS Status:

RoHS non-compliant

REACH Status:

REACH Unaffected

HTSUS:

8542.39.0001

Moisture Sensitivity Level (MSL):

1 (Unlimited)

ECCN:

EAR99

MAX136

Low Power, 3 1/2 Digit A/D Converter with Display Hold

General Description

The MAX136 is a monolithic analog-to-digital converter (ADC) with very high input impedance. It differs from the Maxim ICL7136 in that the MAX136 provides a Hold pin, which makes it possible to hold or "freeze" a reading. The MAX136 directly drives a nonmultiplexed liquid crystal (LCD) display, requiring no external drive circuitry. With minor external component changes, it is pin compatible with the ICL7116 but with significantly reduced power consumption, making the MAX136 a superior device for portable systems.

Versatility and accuracy are inherent features of this ADC. The dual-slope conversion technique automatically rejects interference signals common in industrial environments. True differential inputs allow direct measurements of bridge transducer outputs or load cells. The zero-integrator phase eliminates overrange hangover and hysteresis effects. The MAX136 offers high accuracy by lowering rollover error to less than one count and zero reading drift to less than $1\mu\text{V}/^\circ\text{C}$.

Applications

These devices can be used in a wide range of digital panel meter applications. Most applications, however, involve the measurement and display of analog data:

Voltage	Current
Resistance	Speed
Temperature	Material Thickness

Typical Operating Circuit

Features

- Power Dissipation Guaranteed Less than 1mW—9V Battery Life 3000 Hours Typical
- Hold Pin Allows Indefinite Display Hold
- Guaranteed First Reading Recovery from Overrange
- On-Board Display Drive Capability—No External Circuitry Required
- High-Impedance CMOS Differential Inputs
- Low Noise (< $15\mu\text{Vp-p}$) Without Hysteresis or Overrange Hangover
- Clock and Reference On-Chip
- Zero Input Gives Zero Reading
- True Polarity Indication for Precision Null Applications
- Key Parameters Guaranteed Over Temperature

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V+ to V-)	15V	Power Dissipation (Note 2)	
Analog Input Voltage (either input) (Note 1).....	V+ to V-	PDIP.....	800mW
Reference Input Voltage (either input).....	V+ to V-	Operating Temperature Range	0°C to +70°C
Clock Input, Hold Input.....	TEST to V+	Storage Temperature	-65°C to +160°C

Note 3: Test condition is V_{IN} applied between pins IN-HI and IN-LO, i.e., 1M Ω resistor in Figures 1 and 2.

Note 4: All pins are designed to withstand electrostatic discharge (ESD) levels in excess of 2000V. (Test circuit per Mil. Std. 883C, Method 3015.2)

Note 5: Number of measurement cycles for display to give accurate reading.

Note 6: 1M Ω resistor is removed in Figures 1 and 2.

Note 7: Refer to "Differential Input" discussion (See Maxim's ICL7136 data sheet).

Note 8: Back plane drive is in phase with segment drive for 'off' segment, 180° out of phase for 'on' segment. Frequency is 20 times conversion rate. Average DC component is less than 50mV.

MAX136

Low Power, 3½ Digit A/D Converter with Display Hold

Detailed Description

The MAX136 3½ digit ADC is similar to the Maxim ICL7136 except for the addition of a Hold pin. For a detailed product description, and applications information (other than the operation of the Hold pin described below), refer to Maxim's ICL7136 data sheet.

Hold Input

The Hold input is a digital input with a logic threshold approximately midway between V_+ and Test. The MAX136 continuously performs conversions, independent of the Hold input. When the Hold input is at V_+ the display latch pulse is inhibited, and the display latches

are not updated; when the Hold input is low or at the Test voltage, the display is updated at the end of each conversion. The MAX136 maintains low-power dissipation even during display hold by eliminating the pull-down resistor between Hold and Test present on the ICL7116. The Hold input is CMOS compatible, and can also be driven by a switch connected between Test and V_+ (Figure 1).

Reference Input

Unlike the ICL7136, the MAX136 does not have a reference low input. Apply the reference voltage between Reference High (REF HI) and
