DiGi Electronics Part Number	MAX4237AESA+-DG
Manufacturer	<a href="#">Analog Devices Inc./Maxim Integrated</a>
Manufacturer Product Number	MAX4237AESA+
Description	IC OPAMP GP 1 CIRCUIT 8SOIC
Detailed Description	General Purpose Amplifier 1 Circuit Rail-to-Rail 8-S OIC

Tel: +00 852-30501935

RFQ Email: [Info@DiGi-Electronics.com](mailto:Info@DiGi-Electronics.com)

DiGi is a global authorized distributor of electronic components.

## Purchase and inquiry

Manufacturer Product Number:

MAX4237AESA+

Series:

-

Amplifier Type:

General Purpose

Output Type:

Rail-to-Rail

Gain Bandwidth Product:

7.5 MHz

Voltage - Input Offset:

5  $\mu$ V

Voltage - Supply Span (Min):

2.4 V

Operating Temperature:

-40°C ~ 85°C

Package / Case:

8-SOIC (0.154", 3.90mm Width)

Base Product Number:

MAX4237

Manufacturer:

Analog Devices Inc./Maxim Integrated

Product Status:

Obsolete

Number of Circuits:

1

Slew Rate:

1.3V/ $\mu$ s

Current - Input Bias:

1 pA

Current - Supply:

350 $\mu$ A

Voltage - Supply Span (Max):

5.5 V

Mounting Type:

Surface Mount

Supplier Device Package:

8-SOIC

## Environmental & Export classification

RoHS Status:

ROHS3 Compliant

REACH Status:

REACH Unaffected

HTSUS:

8542.33.0001

Moisture Sensitivity Level (MSL):

1 (Unlimited)

ECCN:

EAR99

**MAXIM**

# SOT23, Very High Precision, 3V/5V Rail-to-Rail Op Amps

## General Description

The MAX4236/MAX4237 are high-precision op amps that feature an exceptionally low offset voltage and offset voltage temperature coefficient without using any chopper techniques. The MAX4236 and MAX4237 have a typical large-signal, open-loop voltage gain of 120dB. These devices have an ultra-low input-bias current of 1pA. The MAX4236 is unity-gain stable with a gain-bandwidth product of 1.7MHz, while the MAX4237 is stable for closed-loop gains greater than 5V/V with a gain-bandwidth product of 7.5MHz. Both devices have a shutdown function in which the quiescent current is reduced to less than 0.1 $\mu$ A, and the amplifier output is forced into a high-impedance state.

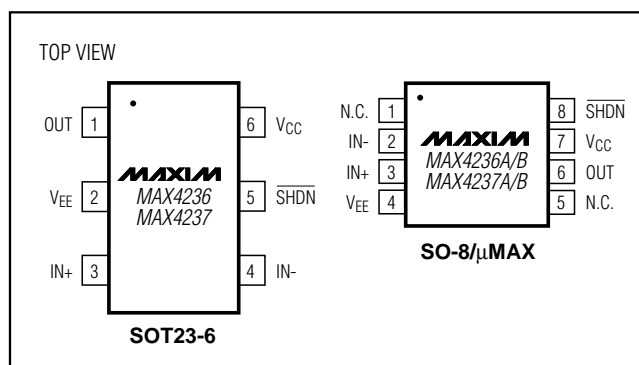

The input common-mode range of the MAX4236/MAX4237 extends below the negative supply range, and the output swings Rail-to-Rail<sup>®</sup>. These features make the amplifiers ideal for applications with +3V or +5V single power supplies. The MAX4236/MAX4237 are specified for the extended temperature range (-40°C to +85°C) and are available in tiny SOT23,  $\mu$ MAX, and SO packages. For greater accuracy, the A grade  $\mu$ MAX and SO packages are tested to guarantee 20 $\mu$ V (max) offset voltage at +25°C and less than 2 $\mu$ V/°C drift.

## Applications

Strain Gauges  
Piezoelectric Sensors  
Thermocouple Amplifiers  
Electrochemical Sensors  
Battery-Powered Instrumentation  
Instrumentation Amplifiers

Rail-to-Rail is a registered trademark of Nippon Motorola, Inc.

## Pin Configurations

## Features

- ♦ **Ultra-Low Offset Voltage**  
20 $\mu$ V (max) at +25°C (Grade A)  
50 $\mu$ V (max) at +25°C (Grade B, 6-Pin SOT23)
- ♦ **Ultra-Low Offset Voltage Drift**  
2 $\mu$ V/°C (max) (Grade A)  
4.5 $\mu$ V/°C (max) (Grade B, 6-Pin SOT23)  
5.5 $\mu$ V/°C (max) (6-Pin SOT23)
- ♦ **Ultra-Low 1pA Input Bias Current**
- ♦ **High Open-Loop Voltage Gain: 110dB (min)**  
(R<sub>L</sub> = 100k $\Omega$ )
- ♦ **Compatible with +3V and +5V Single-Supply Power Systems**
- ♦ **Ground Sensing: Input Common-Mode Range Includes Negative Rail**
- ♦ **Rail-to-Rail Output Swing into a 1k $\Omega$  Load**
- ♦ **350 $\mu$ A Quiescent Current**
- ♦ **Gain-Bandwidth Product**  
1.7MHz (MAX4236, A<sub>V</sub> = 1V/V)  
7.5MHz (MAX4237, A<sub>V</sub> = 5V/V)
- ♦ **200pF Capacitive Load Handling Capability**
- ♦ **Shutdown Mode: 0.1 $\mu$ A Quiescent Current, Places Output in a High-Impedance State**
- ♦ **Available in Space-Saving SOT23 and  $\mu$ MAX Packages**

MAX4236/MAX4237

## Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX4236EUT-T	-40°C to +85°C	6 SOT23-6

# SOT23, Very High Precision, 3V/5V Rail-To-Rail Op Amps

MAX4236/MAX4237

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage ( $V_{CC} - V_{EE}$ ) .....-0.3V to +6V  
 Analog Input Voltage (IN+ or IN-) .....( $V_{EE} - 0.3V$ ) to ( $V_{CC} + 0.3V$ )  
 Logic Input Voltage (SHDN) .....( $V_{EE} - 0.3V$ ) to ( $V_{CC} + 0.3V$ )  
 Current into Any Pin .....20mA  
 Output Short-Circuit Duration....Continuous to Either  $V_{CC}$  or  $V_{EE}$   
 Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )  
   6-Pin SOT23-6 (derate 8.7mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ) .....696mW  
   8-Pin  $\mu\text{MAX}$  (derate 4.5mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ) .....362mW  
   8-Pin SO (derate 5.9mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ).....471mW

Operating Temperature Range .....-40 $^\circ\text{C}$  to +85 $^\circ\text{C}$   
 Junction Temperature .....+150 $^\circ\text{C}$   
 Storage Temperature Range .....-65 $^\circ\text{C}$  to +150 $^\circ\text{C}$   
 Lead Temperature (soldering, 10s) .....+300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS (SO-8 and $\mu\text{MAX}$ -8)

( $V_{CC} = +2.4V$  to  $+5.5V$ ,  $V_{EE} = 0$ ,  $V_{CM} = 0$ ,  $V_{OUT} = V_{CC}/2$ ,  $R_L = 100k\Omega$  to  $V_{CC}/2$ ,  $T_A = T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted. Typical values are at  $V_{CC} = +5V$  and  $T_A = +25^\circ\text{C}$ .) (Note 1)

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS
Supply Voltage Range	$V_{CC}$	Guaranteed by the PSRR test		2.4		5.5	V
Quiescent Supply Current	$I_{CC}$	$V_{CC} = +5V$	In normal mode		350	440	$\mu\text{A}$

## Pin Description

PIN		NAME	FUNCTION
SOT23	SO/ $\mu$ MAX		
1	6	OUT	Amplifier Output
2	4	VEE	Negative Power Supply. Bypass with a 0.1 $\mu$ F capacitor to ground. Connect to GND for single-supply operation.
3	3	IN+	Noninverting Amplifier Input
4	2	IN-	Inverting Amplifier Input
5	8	$\overline{\text{SHDN}}$	Shutdown Input. Do not leave floating. Connect to V <sub>CC</sub> for normal operation or GND to enter the shutdown mode.
6	7	V <sub>CC</sub>	Positive Supply Input. Bypass with a 0.1 $\mu$ F capacitor to ground.
—	1, 5	N.C.	No Connection. Not internally connected.

## Detailed Description

The MAX4236/MAX4237 are high-precision op amps with a CMOS input stage and an excellent set of DC and AC features. The combination of tight maximum voltage offset, low offset tempco and very low input current make them ideal for use in high-precision DC circuits. They feature low-voltage operation, low-power consumption, high-current drive with rail-to-rail output swing and high-gain bandwidth product.

### High Accuracy

The MAX4236/MAX4237 maximum input offset voltage is 20 $\mu$ V (5 $\mu$ V, typ) for grade A version and 50 $\mu$ V for grade B version at +25°C. The maximum temperature coefficient of the offset voltage for grade A and B are guaranteed to be 2 $\mu$ V/°C and 4.5 $\mu$ V/°C respectively. The parts have an input bias current of 1pA. Noise characteristics are 14nV/ $\sqrt{\text{Hz}}$ , and a low frequency noise (0.1Hz to 10Hz) of 0.2 $\mu$ Vp-p. The CMRR is 102dB, and the PSRR is 120dB. The combination is what is necessary for the design of circuits to process signals while keeping high signal-to-noise ratios, as in stages preceding high-resolution converters, or when they are produced by sensors or transducers generating very small outputs.

### Rail-to-Rail Outputs, Ground-Sensing Input

The input common-mode range extends from (V<sub>EE</sub> - 0.15V) to (V<sub>CC</sub> - 1.2V) with excellent common-mode rejection. Beyond this range, the amplifier output is a nonlinear function of the input, but does not undergo phase reversal or latch-up (see *Typical Operating Characteristics*).

The output swings to within 150mV of the power-supply rails with a 1k $\Omega$  load. The input ground sensing and the rail-to-rail output substantially increase the dynamic range.

### Power-Up and Shutdown Mode

The MAX4236/MAX4237 have a shutdown option. When the shutdown pin ( $\overline{\text{SHDN}}$ ) is pulled low, the supply current drops to 0.1 $\mu$ A, and the amplifiers are disabled with the output in a high-impedance state. Pulling  $\overline{\text{SHDN}}$  high enables the amplifiers. The turn-on time for the amplifiers to come out of shutdown is 4 $\mu$ s.

### Applications Information

As described above, the characteristics of the MAX4236/MAX4237 are excellent for high-precision/accuracy circuitry, and the high impedance, low-current, low-offset, and noise specifications are very attractive for piezoelectric transducers applications. In these applications, the sensors generate an amount of electric charge proportional to the changes in the mechanical stress applied to them. These charges are transformed into a voltage proportional to the applied force by injecting them into a capacitance and then amplifying the resulting voltage. The voltage is an inverse function of the capacitance into which the charges generated by the transducer/ sensor are injected. This capacitance and the resistance that discharges it, define the low-frequency response of the circuit. It is desirable, once the preferred low-frequency response is known, to maintain the capacitance as low as possible, because the amount of necessary upstream amplification (and the signal-to-noise ratio deterioration) is directly proportional to the capacitance value. The MAX4236/MAX4237 high-impedance, low-

MAX4236/MAX4237

## SOT23, Very High Precision, 3V/5V Rail-To-Rail Op Amps

current, low-noise inputs allow a minimum of capacitance to be used.

Piezoresistive transducers applications require many of the same qualities. For those applications the MAX4236/MAX4237 high CMRR, PSRR, and offset stability are also a good match.

A typical application for a piezoresistive transducer instrumentation amplifier design using the MAX4236/MAX4237 is shown in the *Typical Application Circuit*.

In general, the MAX4236/MAX4237 are good components for any application in which an amplifier with an almost zero input current is required, including high-precision, long time-constant integrators and electrochemical sensors.

### Power Supplies

The MAX4236/MAX4237 can operate from a single +2.4V to +5.5V power supply, or from  $\pm 1.2V$  to  $\pm 2.75V$  power supplies. The power supply pin(s) must be bypassed to ground with a 0.1 $\mu F$  capacitor as close to the pin as possible.

### Layout and Physical Design

A good layout improves performance by decreasing the amount of parasitic and stray capacitance, inductance and resistance at the amplifier's inputs, outputs, and power-supply connections. Since parasitics might be unavoidable, minimize trace lengths, resistor leads, and place external components as close to the pins as possible.

In high impedance, low input current applications, input lines guarding and shielding, special grounding, and other physical design and layout techniques, are mandatory if good results are expected.

The negative effects of crosstalk, EMI and other forms of interference and noise (thermal, acoustic, etc.) must be accounted for and prevented beforehand for good performance in the type of sensitive circuitry in which the MAX4236/MAX4237 are likely to be used.
