MAX4372T/F/H

Low-Cost, UCSP/SOT23, Micropower, High-Side Current-Sense Amplifier with Voltage Output

General Description

The MAX4372 low-cost, precision, high-side current-sense amplifier is available in a tiny, space-saving SOT23 5-pin package. Offered in three gain versions (T = 20V/V, F = 50V/V, and H = 100V/V), this device operates from a single 2.7V to 28V supply and consumes only 30µA. It features a voltage output that eliminates the need for gain-setting resistors and is ideal for today's notebook computers, cell phones, and other systems where battery/DC current monitoring is critical.

High-side current monitoring is especially useful in battery-powered systems since it does not interfere with the ground path of the battery charger. The input common-mode range of 0 to 28V is independent of the supply voltage and ensures that the current-sense feedback remains viable even when connected to a 2-cell battery pack in deep discharge.

The user can set the full-scale current reading by choosing the device (T, F, or H) with the desired voltage gain and selecting the appropriate external sense resistor. This capability offers a high level of integration and flexibility, resulting in a simple and compact current-sense solution. For higher bandwidth applications, refer to the MAX4173T/F/H data sheet.

Applications

- Power-Management Systems
- General-System/Board-Level Current Monitoring
- Notebook Computers
- Portable/Battery-Powered Systems
- Smart-Battery Packs/Chargers
- Cell Phones
- Precision-Current Sources

Features

- Low-Cost, Compact Current-Sense Solution
- 30µA Supply Current
- 2.7V to 28V Operating Supply
- 0.18% Full-Scale Accuracy
- 0.3mV Input Offset Voltage
- Low 1.5Ω Output Impedance
- Three Gain Versions Available
  - 20V/V (MAX4372T)
  - 50V/V (MAX4372F)
  - 100V/V (MAX4372H)
- High Accuracy +2V to +28V Common-Mode Range, Functional Down to 0V, Independent of Supply Voltage
- Available in a Space-Saving 5-Pin SOT23 Package and 3 x 2 UCSP™ (1mm x 1.5mm) Package

Detailed Description

The MAX4372 high-side current-sense amplifier features a 0 to 28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current flow out of a battery in deep discharge, and also enables high-side current sensing at voltages far in excess of the supply voltage (V_{CC}).

Current flows through the sense resistor, generating a sense voltage (Figure 1. Functional Diagram). Since A1's inverting input is high impedance, the voltage on the negative terminal equals V_{IN} - V_{SENSE}. A1 forces its positive terminal to match its negative terminal; therefore, the voltage across R_{G1} (V_{IN} - V1-) equals V_{SENSE}. This creates a current to flow through R_{G1} equal to V_{SENSE}/R_{G1}. The transistor and current mirror amplify the current by a factor of β. This makes the current flowing out of the current mirror equal to:

$$I_M = \beta \, V_{SENSE}/R_{G1}$$

A2's positive terminal presents high impedance, so this current flows through R_{GD}, with the following result:

$$V2+ = R_{GD} \, \beta \times V_{SENSE}/R_{G1}$$

R1 and R2 set the closed-loop gain for A2, which amplifies V2+, yielding:

$$V_{OUT} = R_{GD} \times \beta \times V_{SENSE}/R_{G1} \, (1 + R2/R1)$$

The gain of the device equals:

$$\frac{V_{OUT}}{V_{SENSE}} = RGD \times \beta (1 + R2/R1)/R_{G1}$$

Applications Information

Recommended Component Values

The MAX4372 operates over a wide variety of current ranges with different sense resistors. Table 1 lists common resistor values for typical operation of the MAX4372.

Choosing R_{SENSE}

Given the gain and maximum load current, select R_{SENSE} such that V_{OUT} does not exceed V_{CC} - 0.25V or 10V. To measure lower currents more accurately, use a high value for R_{SENSE}. A higher value develops a higher sense voltage, which overcomes offset voltage errors of the internal current amplifier.

In applications monitoring very high current, ensure R_{SENSE} is able to dissipate its own I^2R losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings.

Using a PC Board Trace as R_{SENSE}

If the cost of R_{SENSE} is an issue and accuracy is not critical, use the alternative solution shown in Figure 2. This solution uses copper PC board traces to create a sense resistor. The resistivity of a 0.1in wide trace of 2oz copper is about 30mΩ/ft. The resistance temperature coefficient of copper is fairly high (approximately 0.4%/°C), so systems that experience a wide temperature variance must compensate for this effect. In addition, self-heating introduces a nonlinearity error. Do not exceed the maximum power dissipation of the copper trace.

For example, the MAX4372T (with a maximum load current of 10A and an R_{SENSE} of 5mΩ) creates a full-scale V_{SENSE} of 50mV that yields a maximum V_{OUT} of 1V. R_{SENSE}, in this case, requires about 2in of 0.1in wide copper trace.
