MAX700/MAX701/MAX702 Power-Supply Monitor with Reset

General Description

The MAX700/MAX701/MAX702 are supervisory circuits used to monitor the power supplies in microprocessor (µP) and digital systems. The $\overline{RESET}$/RESET outputs of the MAX700/MAX701/MAX702 are guaranteed to be in the correct state for V_{CC} voltages down to +1V (Figure 4). They provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with +5V-powered circuits.

The MAX702 is the simplest part in the family. When V_{CC} falls to 4.65V, $\overline{RESET}$ goes low. The MAX702 also provides a debounced manual-reset input. The MAX701 performs the same functions but has both $\overline{RESET}$ and RESET outputs. Their primary function is to provide a system reset. Accordingly, an active reset signal is supplied for low supply voltages and for at least 200ms after the supply voltage reaches its operating value.

In addition to the features of the MAX701 and MAX702, the MAX700 provides preset or adjustable-voltage detection so thresholds other than 4.65V can be selected, and adjustable hysteresis. All parts are supplied in 8-pin PDIP and narrow-SO packages in commercial and extended temperature ranges.

Pin Description

PIN			NAME	FUNCTION
MAX700	MAX701	MAX702		
1	1	1	MR	Input for Manual Pushbutton Reset. Has internal 5µA pullup. Low input activates the RESET/$\overline{\text{RESET}}$ outputs.
2	—	—	SENSE	The voltage-sense input when CTL = V_{CC}. Its threshold is 1.29V. SENSE always remains connected to the internal comparator. So, when V_{CC} is being monitored internally (CTL = GND), SENSE should be left open circuit.
3	—	—	HYST	Normally NOT used when voltage is monitored through V_{CC} (CTL = GND). When monitoring through SENSE (CTL = V_{CC}), HYST allows hysteresis to be added, reducing noise and spurious reset activity (Figure 3). HYST turns on 5µs before the RESET/$\overline{\text{RESET}}$ outputs are activated, and its on-resistance to GND is typically 1kΩ.
4	4	3	GND	Ground
5	6	7	$\overline{\text{RESET}}$	Goes low when V_{CC} falls below 4.65V, or when CTL = V_{CC} on the MAX700 goes low when SENSE falls below 1.29V.
6	5	—	RESET	Inverted Version of $\overline{\text{RESET}}$
7	—	—	CTL	When CTL = GND, V_{CC} is monitored by the reset circuit. When CTL = V_{CC}, V_{CC} is ignored and SENSE is monitored, allowing the threshold to be set with external resistors.
8	8	2	V_{CC}	Chip Power and +5V Sensing Input (When CTL = GND on MAX700)
—	2, 3, 7	4, 5, 6, 8	N.C.	No Connection

Figure 4 shows the $\overline{\text{RESET}}$ output of the MAX700/MAX701/MAX702 in the correct state for V_{CC} voltages down to 0V. Note the effect of the built-in hysteresis on the trigger lever of $\overline{\text{RESET}}$.
