# 3.3V ZERO DELAY CLOCK MULTIPLIER

### FEATURES:

- Phase-Lock Loop Clock Distribution for Applications ranging from 10MHz to 133MHz operating frequency
- · Distributes one clock input to two banks of four outputs
- · Separate output enable for each output bank
- External feedback (FBK) pin is used to synchronize the outputs to the clock input
- Output Skew <200 ps
- Low jitter <200 ps cycle-to-cycle</li>
- 1x, 2x, 4x output options (see table):
  - IDT2308-1 1x
  - IDT2308-2 1x, 2x
  - IDT2308-3 2x, 4x
  - IDT2308-4 2x
  - IDT2308-1H, -2H, and -5H for High Drive
- · No external RC network required
- Operates at 3.3V VDD
- Available in SOIC and TSSOP packages

### **DESCRIPTION:**

The IDT2308 is a high-speed phase-lock loop (PLL) clock multiplier. It is designed to address high-speed clock distribution and multiplication applications. The zero delay is achieved by aligning the phase between the incoming clock and the output clock, operable within the range of 10 to 133MHz.

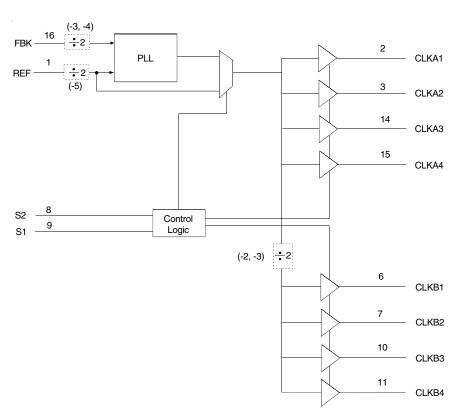

The IDT2308 has two banks of four outputs each that are controlled via two select addresses. By proper selection of input addresses, both banks can be put in tri-state mode. In test mode, the PLL is turned off, and the input clock directly drives the outputs for system testing purposes. In the absence of an input clock, the IDT2308 enters power down, and the outputs are tri-stated. In this mode, the device will draw less than  $25\mu$ A.

The IDT2308 is available in six unique configurations for both prescaling and multiplication of the Input REF Clock. (See available options table.)

The PLL is closed externally to provide more flexibility by allowing the user to control the delay between the input clock and the outputs.

The IDT2308 is characterized for both Industrial and Commercial operation.

NOTES:

 Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

3. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.

### **APPLICATIONS:**

- SDRAM
- Telecom
- Datacom
- PC Motherboards/Workstations
- · Critical Path Delay Designs

#### **COMMERCIAL AND INDUSTRIAL TEMPERATURE RANGES**

### ZERO DELAY AND SKEW CONTROL

To close the feedback loop of the IDT2308, the FBK pin can be driven from any of the eight available output pins. The output driving the FBK pin will be driving a total load of 7pF plus any additional load that it drives. The relative loading of this output (with respect to the remaining outputs) can adjust the input-output delay.

For applications requiring zero input-output delay, all outputs including the one providing feedback should be equally loaded. If input-output delay adjustments are required, use the Output Load Difference Chart to calculate loading differences between the feedback output and remaining outputs. Ensure the outputs are loaded equally, for zero output-output skew.
