Axcelerator Family FPGAs Datasheet

Introduction

This datasheet covers Antifuse family of FPGAs and Axcelerator devices, which provides exceptional design security and outstanding performance at densities of up to two million equivalent system gates. Axcelerator devices, which use our AX architecture, have a number of system-level capabilities including segmentable clocks, PLLs, chip-wide highway routing, embedded SRAM (with embedded FIFO control logic), and the capacity to carry logic. Axcelerator devices, which are developed using a CMOS antifuse process technique based on 0.15 µm and seven layers of metal, provide a higher level of performance that was previously limited to ASIC technology.

Benefits

The following are the benefits of Axcelerator devices:

- 350+ MHz System Performance
- 500+ MHz Internal Performance
- High-Performance Embedded FIFOs
- 700 Mb/s LVDS Capable I/Os

Specifications

The following are the specifications of the Axcelerator devices:

- Up to 2 Million Equivalent System Gates
- Up to 684 I/Os
- Up to 10,752 Dedicated Flip-Flops
- Up to 295 kbits Embedded SRAM/FIFO
- Manufactured on Advanced 0.15 µm CMOS Antifuse Process Technology, 7 Layers of Metal

Features

The following are the features of the Axcelerator devices:

- Single-Chip, Nonvolatile Solution
- Up to 100% Resource Utilization with 100% Pin Locking
- 1.5V Core Voltage for Low Power
- Footprint Compatible Packaging
- Flexible, Multi-Standard I/Os:
  - 1.5V, 1.8V, 2.5V, 3.3V mixed voltage operation
  - Bank-selectable I/Os—8 banks per chip
  - Single-ended I/O standards: LVTTL, LVCMOS, 3.3V PCI, and 3.3V PCI-X
  - Differential I/O standards: LVPECL and LVDS

  - Voltage-referenced I/O standards: GTL+, HSTL Class 1, SSTL2 Class 1 and 2, and SSTL3 Class 1 and 2
  - Registered I/Os
  - Hot-swap compliant I/Os (except PCI)
  - Programmable slew rate and drive strength on outputs
  - Programmable delay and weak pull-up/pull-down circuits on inputs
- Embedded Memory:
  - Variable-aspect 4,608-bit RAM blocks (x1, x2, x4, x9, x18, and x36 organizations available)
  - Independent, width-configurable read and write ports
  - Programmable embedded FIFO control logic
- Segmentable Clock Resources
- Embedded Phase-Locked Loop:
  - 14–200 MHz input range
  - Frequency synthesis capabilities up to 1 GHz
- Deterministic and User-Controllable Timing
- Unique In-System Diagnostic and Debug Capability with Microchip Silicon Explorer II
- Boundary-Scan Testing Compliant with IEEE Standard 1149.1 (JTAG)
- FuseLock™ Programming Technology Protects Against Reverse Engineering and Design Theft

The following table shows the Axcelerator family product profile.

Table 1. Axcelerator Family Product Profile

Table of Contents

1. General Description

Axcelerator devices offer high performance at densities of up to two million equivalent system gates. Based upon the Microchip AX architecture, Axcelerator has several system-level features such as embedded SRAM (with complete FIFO control logic), PLLs, segmentable clocks, chip-wide highway routing, and carry logic.

1.1 Device Architecture

AX architecture, derived from the highly-successful SX-A sea-of-modules architecture, has been designed for high performance and total logic module utilization (see Figure 1-1). Unlike in traditional FPGAs, the entire floor of the Axcelerator device is covered with a grid of logic modules, with virtually no chip area lost to interconnect elements or routing.

1.1.1 Programmable Interconnect Element

The Axcelerator family uses a patented metal-to-metal antifuse programmable interconnect element that resides between the upper two layers of metal (see the following figures). This completely eliminates the channels of routing and interconnect resources between logic modules (as implemented on traditional FPGAs) and enables the efficient sea-of-modules architecture. The antifuses are normally open circuit and, when programmed, form a permanent, passive, low-impedance connection, leading to the fastest signal propagation in the industry. In addition, the extremely small size of these interconnect elements gives the Axcelerator family abundant routing resources.

The very nature of Microchip's nonvolatile antifuse technology provides excellent protection against design pirating and cloning (FuseLock technology). Typical cloning attempts are impossible (even if the security fuse is left unprogrammed), as no bitstream or programming file is ever downloaded or stored in the device. Reverse engineering is virtually impossible due to the difficulty of trying to distinguish between programmed and unprogrammed antifuses and also due to the programming methodology of antifuse devices (see Security).

Figure 1-1. Sea-of-Modules Comparison

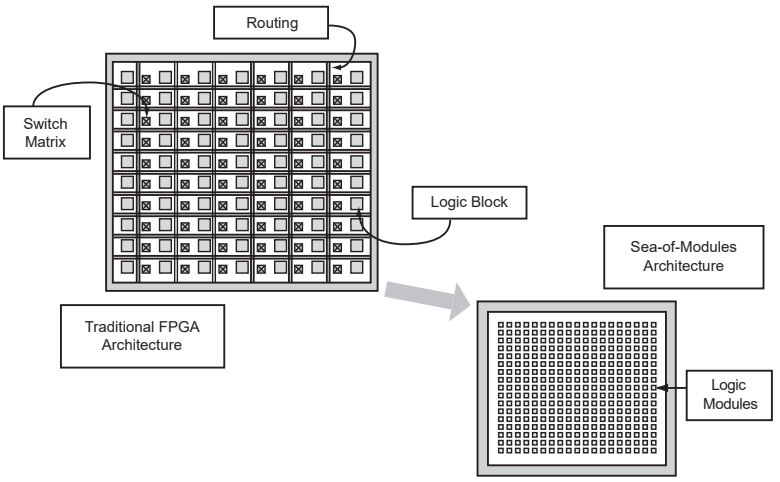

Figure 1-2. Axcelerator Family Interconnect Elements

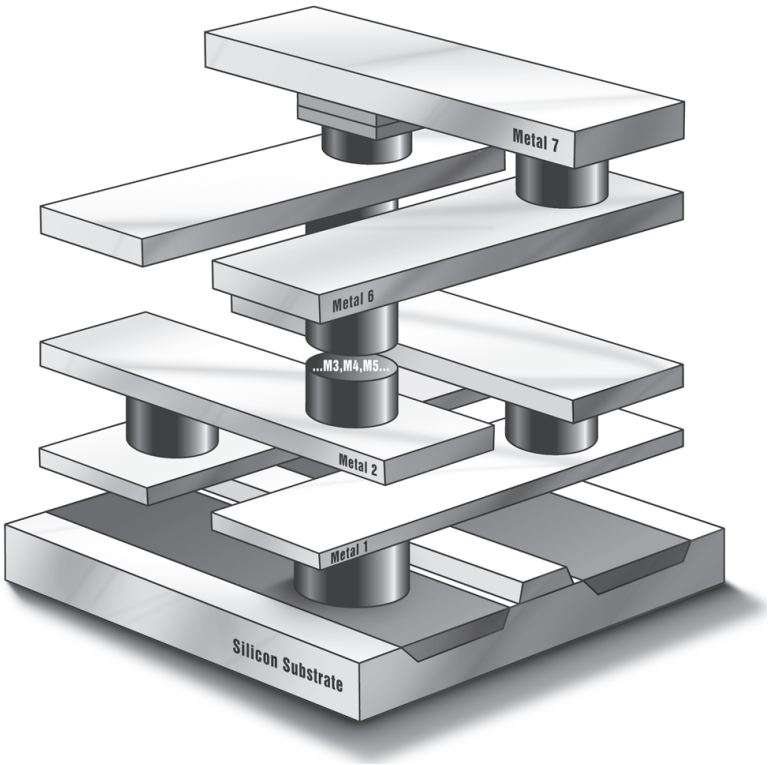
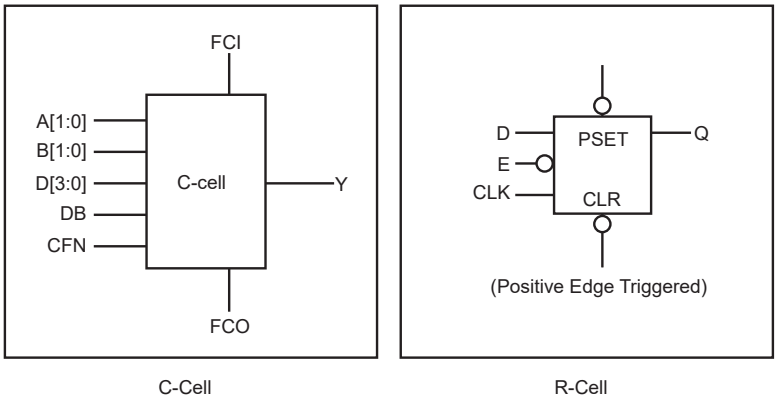


1.1.2 Logic Modules

Microchip's Axcelerator family provides two types of logic modules: The register cell (R-cell) and the combinatorial cell (C-cell). The Axcelerator device can implement more than 4,000 combinatorial functions of up to five inputs (see the following figure).

Figure 1-3. AX C-Cell and R-Cell

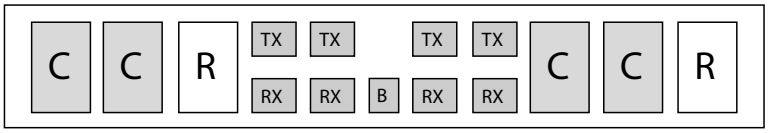


The R-cell contains a flip-flop featuring asynchronous clear, asynchronous preset, and active-low enable control signals (see the preceeding figure). The R-cell registers feature programmable clock polarity selectable on a register-by-register basis. This provides additional flexibility (for example, easy mapping of dual-data-rate functions into the FPGA), while conserving valuable clock resources. The clock source for the R-cell can be chosen from the hardwired clocks, routed clocks, or internal logic.

Two C-cells, a single R-cell, two Transmit (TX), and two Receive (RX) routing buffers form a Cluster, while two Clusters comprise a SuperCluster (see the following figure). Each SuperCluster also

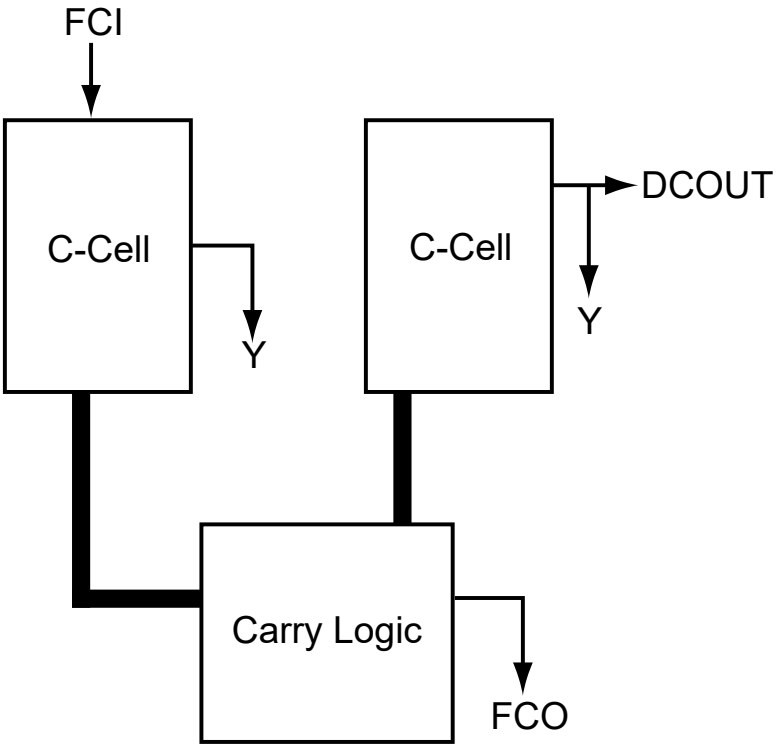
contains an independent Buffer (B) module, which supports buffer insertion on high-fanout nets by the place-and-route tool, minimizing system delays while improving logic utilization.

Figure 1-4. AX SuperCluster



The logic modules within the SuperCluster are arranged so that two combinatorial modules are side by side, giving a C–C–R – C–C–R pattern to the SuperCluster. This C–C–R pattern enables efficient implementation (minimum delay) of two-bit carry logic for improved arithmetic performance (see the following figure).

Figure 1-5. AX 2-Bit Carry Logic



The AX architecture is fully fracturable, meaning that if one or more of the logic modules in a SuperCluster are used by a particular signal path, the other logic modules are still available for use by other paths.

At the chip level, SuperClusters are organized into core tiles, which are arrayed to build up the full chip. For example, the AX1000 is composed of a 3x3 array of nine core tiles. The array of core tiles is surrounded by blocks of I/O Clusters and the I/O bank ring (see the following table). Each core tile consists of an array of 336 SuperClusters and four SRAM blocks (176 SuperClusters and three SRAM blocks for the AX250).

The following table shows the number of core tiles per device.

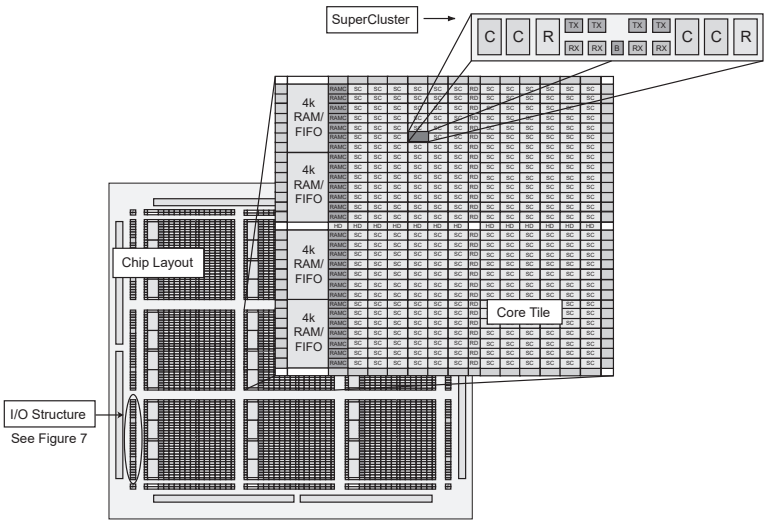
Table 1-1. Number of Core Tiles per Device

Device	Number of Core Tiles
AX125	1 regular tile

.....continued	
Device	**Number of Core Tiles**
AX250	4 smaller tiles
AX500	4 regular tiles
AX1000	9 regular tiles
AX2000	16 regular tiles

The SRAM blocks are arranged in a column on the west side of the tile (see the following figure).

Figure 1-6. AX Device Architecture (AX1000 shown)



1.1.3 Embedded Memory

As mentioned earlier, each core tile has either three (in a smaller tile) or four (in the regular tile) embedded SRAM blocks along the west side, and each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are: 128x36, 256x18, 512x9, 1kx4, 2kx2, or 4kx1 bits. The individual blocks have separate read and write ports that can be configured with different bit widths on each port. For example, data can be written in by eight and read out by one.

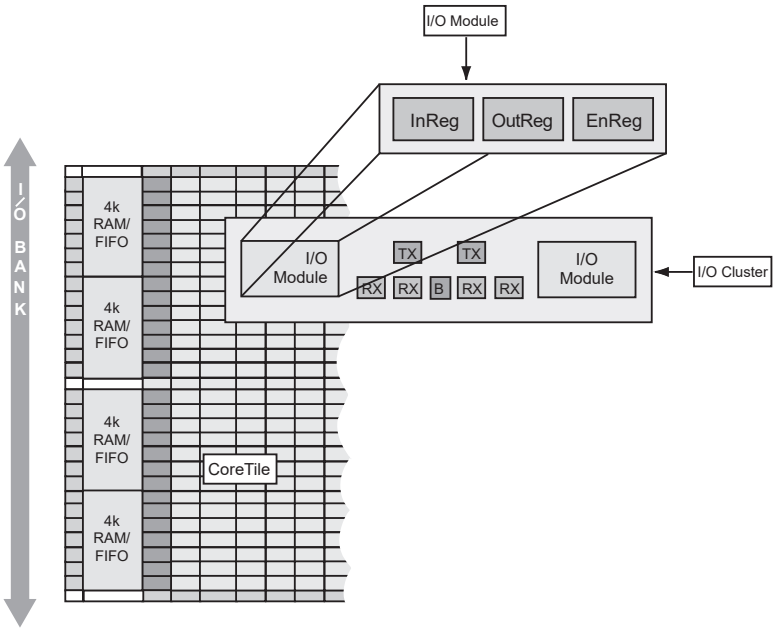
In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using core logic modules. The FIFO width and depth are programmable. The FIFO also features programmable ALMOST-EMPTY (AEMPTY) and ALMOST-FULL (AFULL) flags in addition to the normal EMPTY and FULL flags. In addition to the flag logic, the embedded FIFO control unit also contains the counters necessary for the generation of the read and write address pointers as well as control circuitry to prevent metastability and erroneous operation. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

1.1.4 I/O Logic

The Axcelerator family of FPGAs features a flexible I/O structure, supporting a range of mixed voltages with its bank-selectable I/Os: 1.5V, 1.8V, 2.5V, and 3.3V. In all, Axcelerator FPGAs support at least 14 different I/O standards (single-ended, differential, and voltage-referenced). The I/Os are organized into banks with eight banks per device (two per side). The configuration of these banks determines the I/O standards supported (For more information, see User I/Os2). All I/O standards are available in each bank.

Each I/O module has an input register (InReg), an output register (OutReg), and an enable register (EnReg) (see the following figure). An I/O Cluster includes two I/O modules, four RX modules, two TX modules, and a buffer (B) module.

Figure 1-7. I/O Cluster Arrangement



1.1.5 Routing

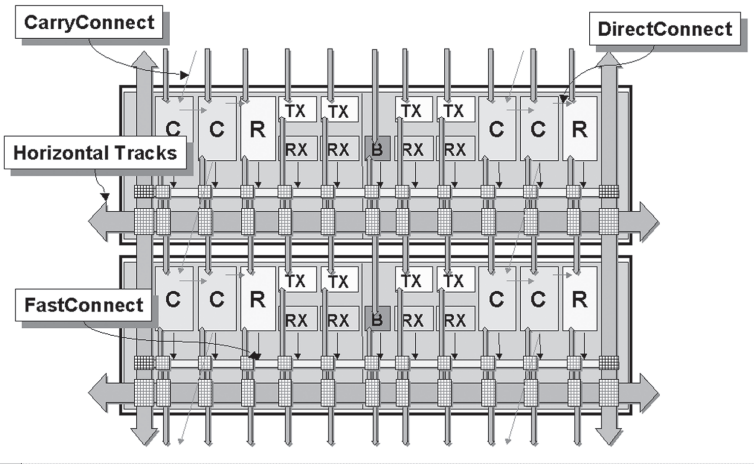
The AX hierarchical routing structure ties the logic modules, the embedded memory blocks, and the I/O modules together (see the following figure). At the lowest level, in and between SuperClusters, there are three local routing structures: FastConnect, DirectConnect, and CarryConnect routing. DirectConnects provide the highest performance routing inside the SuperClusters by connecting a C-cell to the adjacent R-cell. DirectConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

FastConnects provide high-performance, horizontal routing inside the SuperCluster and vertical routing to the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering a maximum routing delay of 0.4 ns.

CarryConnects are used for routing carry logic between adjacent SuperClusters. They connect the FCO output of one two-bit, C-cell carry logic to the FCI input of the two-bit, C-cell carry logic of the SuperCluster below it. CarryConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

The next level contains the core tile routing. Over the SuperClusters within a core tile, both vertical and horizontal tracks run across rows or columns, respectively. At the chip level, vertical and horizontal tracks extend across the full length of the device, both north to south and east to west. These tracks are composed of highway routing that extend the entire length of the device (segmented at core tile boundaries), as well as segmented routing of varying lengths.

Figure 1-8. AX Routing Structures



1.1.6 Global Resources

Each family member has three types of global signals available to the designer: HCLK, CLK, and GCLR/GPSET. There are four Hardwired Clocks (HCLK) per device that can directly drive the clock input of each R-cell. Each of the four Routed Clocks (CLK) can drive the clock, clear, preset, or enable pin of an R-cell or any input of a C-cell (see Figure 1-3).

Global Clear (GCLR) and Global Preset (GPSET) drive the clear and preset inputs of each R-cell as well as each I/O Register on a chip-wide basis at power-up.

Each HCLK and CLK has an associated analog PLL (a total of eight per chip). Each embedded PLL can be used for clock delay minimization, clock delay adjustment, or clock frequency synthesis. The PLL is capable of operating with input frequencies ranging from 14 MHz to 200 MHz and can generate output frequencies between 20 MHz and 1 GHz. The clock can be either divided or multiplied by factors ranging from 1 to 64. Additionally, multiply and divide settings can be used in any combination as long as the resulting clock frequency is between 20 MHz and 1 GHz. Adjacent PLLs can be cascaded to create complex frequency combinations.

The PLL can be used to introduce either a positive or a negative clock delay of up to 3.75 ns in 250 ps increments. The reference clock required to drive the PLL can be derived from three sources: external input pad (either single-ended or differential), internal logic, or the output of an adjacent PLL.

1.1.7 Low Power (LP) Mode

The AX architecture was created for high-performance designs but also includes a low power mode (activated via the LP pin). When the low power mode is activated, I/O banks can be disabled (inputs disabled and outputs tristated), and PLLs can be placed in a power-down mode. All internal register states are maintained in this mode. Furthermore, individual I/O banks can be configured to opt out of the LP mode, thereby giving the designer access to critical signals while the rest of the chip is in low power mode.

The power can be further reduced by providing an external voltage source (VPUMP) to the device to bypass the internal charge pump. For more information, see Low Power Mode.

1.2 Design Environment

The Axcelerator family of FPGAs is fully supported by both Microchip's Libero® Integrated Design Environment and Designer FPGA Development software. Libero IDE is an integrated design manager that seamlessly integrates design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Additionally, Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design

in a single environment (see the Libero IDE Flow diagram located on the Microchip website). Libero IDE includes Synplify® Actel Edition (AE) from Synplicity®, ViewDraw® AE from Mentor Graphics®, ModelSim® HDL Simulator from Mentor Graphics, WaveFormer Lite™ AE from SynaptiCAD®, and Designer software from Microchip.

Designer software is a place-and-route tool and provides a comprehensive suite of backend support tools for FPGA development. The Designer software includes the following:

- Timer: a world-class integrated static timing analyzer and constraints editor which support timing-driven place-and-route
- NetlistViewer: a design netlist schematic viewer
- ChipPlanner: a graphical floorplanner viewer and editor
- SmartPower: allows the designer to quickly estimate the power consumption of a design
- PinEditor: a graphical application for editing pin assignments and I/O attributes
- I/O Attribute Editor: displays all assigned and unassigned I/O macros and their attributes in a spreadsheet format

With the Designer software, a user can lock the design pins before layout while minimally impacting the results of place-and-route. Additionally, Microchip's back-annotation flow is compatible with all the major simulators and the simulation results can be cross-probed with Silicon Explorer II, Microchip's integrated verification and logic analysis tool. Another tool included in the Designer software is the SmartGen core generator, which easily creates popular and commonly used logic functions for implementation into your schematic or HDL design.

Designer software is compatible with the most popular FPGA design entry and verification tools from EDA vendors, such as Mentor Graphics, Synplicity, Synopsys, and Cadence Design Systems. The Designer software is available for both the Windows® and UNIX® operating systems.

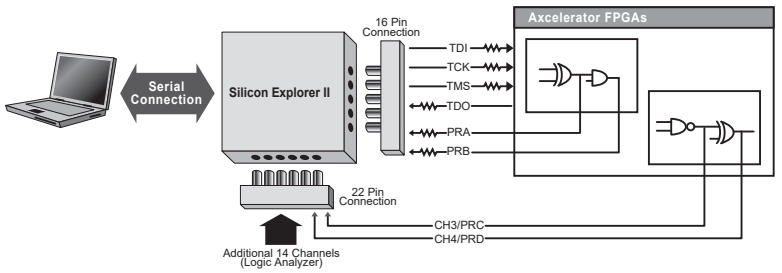
1.2.1 Programming

Programming support is provided through Silicon Sculptor II, a single-site programmer driven through a PC-based GUI. In addition, BP Microsystems offers multi-site programmers that provide qualified support for Microchip devices. Factory programming is available for high-volume production needs.

1.2.2 In-System Diagnostic and Debug Capabilities

The Axcelerator family of FPGAs includes internal probe circuitry, allowing the designer to dynamically observe and analyze any signal inside the FPGA without disturbing normal device operation (see the following figure).

Figure 1-9. Probe Setup



Up to four individual signals can be brought out to dedicated probe pins (PRA/B/C/D) on the device. The probe circuitry is accessed and controlled through Silicon Explorer II, Microchip's integrated verification and logic analysis tool that attaches to the serial port of a PC and communicates with the FPGA through the JTAG port. For more information, see Silicon Explorer II Probe Interface.

1.3 Summary

Microchip's Axcelerator family of FPGAs extends the successful SX-A architecture, adding embedded RAM/FIFOs, PLLs, and high-speed I/Os. With the support of a suite of robust software tools, design engineers can incorporate high gate counts and fixed pins into an Axcelerator design yet still achieve high performance and efficient device utilization.

2. Electrical Specifications

This section decribes the detailed electrical specifications.

2.1 Operating Conditions

The following table lists the absolute maximum ratings of Axcelerator devices. Stresses beyond the ratings may cause permanent damage to the device. Exposure to Absolute Maximum rated conditions for extended periods may affect device reliability.

Table 2-1. Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
VCCA	DC core supply voltage	–0.3 to 1.7	V
VCCI	DC I/O supply voltage	–0.3 to 3.75	V
VREF	DC I/O reference voltage	–0.3 to 3.75	V
VI	Input voltage	–0.5 to 4.1	V
VO	Output voltage	–0.5 to 3.75	V
TSTG	Storage temperature	–60 to +150	°C
VCCDA[1]	Supply voltage for differential I/Os	–0.3 to 3.75	V

Note:

1. Should be the maximum of all VCCI.

Devices should not be operated outside the recommendations given in the following table.

Table 2-2. Recommended Operating Conditions

Parameter Range	Commercial	Industrial	Military	Units
Junction temperature	0 to +70	–40 to +85	–55 to +125	°C
1.5V Core Supply voltage	1.425 to 1.575	1.425 to 1.575	1.425 to 1.575	V
1.5V I/O Supply voltage	1.425 to 1.575	1.425 to 1.575	1.425 to 1.575	V
1.8V I/O Supply voltage	1.71 to 1.89	1.71 to 1.89	1.71 to 1.89	V
2.5V I/O Supply voltage	2.375 to 2.625	2.375 to 2.625	2.375 to 2.625	V
3.3V I/O Supply voltage	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VCCDA Supply voltage	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V
VPUMP Supply voltage	3.0 to 3.6	3.0 to 3.6	3.0 to 3.6	V

2.1.1 Power-Up/Down Sequence

All Axcelerator I/Os are tristated during power-up until normal device operating conditions are reached, when I/Os enter user mode. VCCDA should be powered up before (or coincidentally with) VCCA and VCCI to ensure the behavior of user I/Os at system start-up. Conversely, VCCDA should be powered down after (or coincidentally with) VCCA and VCCI. The VCCI and VCCA can be powered up in any sequence with respect to each other, provided the requirement with respect to VCCDA is satisfied.

2.1.2 Calculating Power Dissipation

The following table lists the standby current values.

Table 2-3. Standby Current

Device	Temperature	ICCA	ICCDA	ICCBANK		ICCPLL	ICCCP[1]		IIH, IIL, IOZ[2]	Units
		Standby Current (Core)	Standby Current, Differential I/O	Standby Current per I/O Bank		Standby Current per PLL	Standby Current, Charge Pump			
				2.5V VCCI	3.3V VCCI		Active	Bypassed Mode		
AX125	Typical at 25 °C	1.5	1.5	0.2	0.3	0.2	0.3	0.01	±0.01	mA
	70 °C	15	6	0.5	0.75	1	0.4	0.01	±0.01	mA
	85 °C	25	6	0.6	0.8	1	0.4	0.2	±0.01	mA
	125 °C	50	8	1	1.5	2	0.4	0.5	±0.01	mA
AX250	Typical at 25 °C	1.5	1.4	0.25	0.4	0.2	0.3	0.01	±0.01	mA

	85 °C	40	7	0.8	1	1	0.4	0.2	±0.01	mA
	125 °C	70	9	1.3	1.8	2	0.4	0.5	±0.01	mA
AX500	Typical at 25 °C	5	1.4	0.4	0.75	0.2	0.3	0.01	±0.01	mA
	70 °C	60	7	1	1.5	1	0.4	0.01	±0.01	mA
	85 °C	80	7	1	1.9	1	0.4	0.2	±0.01	mA
	125 °C	180	9	1.75	2.5	1.5	0.4	0.5	±0.01	mA
AX1000	Typical at 25 °C	7.5	1.5	0.5	1.25	0.2	0.3	0.01	±0.01	mA
	70 °C	80	8	1.5	3	1	0.4	0.01	±0.01	mA
	85 °C	120	8	1.5	3.4	1	0.4	0.2	±0.01	mA
	125 °C	200	10	3	4	1.5	0.4	0.5	±0.01	mA
AX2000	Typical at 25 °C	20	1.6	0.7	1.5	0.2	0.3	0.01	±0.01	mA
	70 °C	160	10	2	7	1	0.4	0.01	±0.01	mA
	85 °C	200	10	3	8	1	0.4	0.2	±0.01	mA
	125 °C	500	15	4	10	1.5	0.4	0.5	±0.01	mA

Notes:

1. ICCCP Active is the ICCDA or the Internal Charge Pump current. ICCCP Bypassed mode is the External Charge Pump current IIH (VPUMP pin).
2. IIH, IIL, or IOZ values are measured with inputs at the same level as VCCI for IIH and GND for IIL and IOZ.

The following table lists the default values (C_{LOAD}, VCCI, P_{LOAD}, P10, and PI/O) of I/O standard.

Table 2-4. Default Values of I/O Standard

I/O Standard	C_{LOAD} (pF)	VCCI (V)	P_{LOAD} (mw/MHz)	P10 (mw/MHz)	PI/O (mW/MHz)[1]
Single-Ended without VREF					
LVTTL 24 mA High Slew	35	3.3	381.2	267.5	648.7
LVTTL 16 mA High Slew	35	3.3	381.2	225.1	606.3
LVTTL 12 mA High Slew	35	3.3	381.2	165.9	547.1
LVTTL 8 mA High Slew	35	3.3	381.2	130.3	511.5
LVTTL 24 mA Low Slew	35	3.3	381.2	169.2	550.4
LVTTL 16 mA Low Slew	35	3.3	381.2	150.8	532.0
LVTTL 12 mA Low Slew	35	3.3	381.2	138.6	519.8
LVTTL 8 mA Low Slew	35	3.3	381.2	118.7	499.9
LVCMOS—25	35	2.5	218.8	148.0	366.8
LVCMOS—18	35	1.8	113.4	73.4	186.8

.....continued					
I/O Standard	**C_{LOAD} (pF)**	**VCCI (V)**	**P_{LOAD} (mw/MHz)**	**P10 (mw/MHz)**	**PI/O (mW/MHz)[1]**

Note:

1. $PI/O = P10 + C_{LOAD} \times VCCI^2$

The following table lists the different components contributing to the total power consumption in axcelerator devices.

Table 2-5. Different Components Contributing to the Total Power Consumption in Axcelerator Devices

Component	Definition	Device Specific Value (in µW/MHz)				
		AX125	AX250	AX500	AX1000	AX2000
P1	Core tile HCLK power component	33	49	71	130	216
P2	R-cell power component	0.2	0.2	0.2	0.2	0.2
P3	HCLK signal power dissipation	4.5	4.5	9	13.5	18
P4	Core tile RCLK power component	33	49	71	130	216
P5	R-cell power component	0.3	0.3	0.3	0.3	0.3
P6	RCLK signal power dissipation	6.5	6.5	13	19.5	26
P7	Power dissipation due to the switching activity on the R-cell	1.6	1.6	1.6	1.6	1.6
P8	Power dissipation due to the switching activity on the C-cell	1.4	1.4	1.4	1.4	1.4
P9	Power component associated with the input voltage	10	10	10	10	10
P10	Power component associated with the output voltage	See Package Pin Assignments				
P11	Power component associated with the read operation in the RAM block	25	25	25	25	25
P12	Power component associated with the write operation in the RAM block	30	30	30	30	30
P13	Core PLL power component	1.5	1.5	1.5	1.5	1.5

Power Dissipation is calculated using the following equations.

- $P_{total} = P_{dc} + P_{ac}$
  - $P_{dc} = I_{CCA} \times VCCA$
  - $P_{ac} = P_{HCLK} + P_{CLK} + P_{R\text{-}cells} + P_{C\text{-}cells} + P_{inputs} + P_{outputs} + P_{memory} + P_{PLL}$
- $P_{HCLK} = (P1 + P2 \times s + P3 \times sqrt[s]) \times Fs$
  - s = the number of R-cells clocked by this clock
  - Fs = the clock frequency

- P_{CLK} = (P4 + P5 × s + P6 × sqrt[s]) × Fs
  - s = the number of R-cells clocked by this clock
  - Fs = the clock frequency
- $P_{R\text{-}cells}$ = P7 × ms × Fs
  - ms = the number of R-cells switching at each Fs cycle
  - Fs = the clock frequency
- $P_{C\text{-}cells}$ = P8 × mc × Fs
  - Fs = the clock frequency
  - mc = the number of C-cells switching at each Fs cycle
- P_{inputs} = P9 × pi × Fpi
  - pi = the number of inputs
  - Fpi = the average input frequency
- $P_{outputs}$ = PI/O × po × Fpo
  - C_{load} = the output load (technology dependent)
  - VCCI = the output voltage (technology dependent)
  - po = the number of outputs
  - F_{po} = the average output frequency
- P_{memory} = P11 × N_{block} × F_{RCLK} + P12 × N_{block} × F_{WCLK}
  - N_{block} = the number of RAM/FIFO blocks (1 block = 4k)
  - F_{RCLK} = the read-clock frequency of the memory
  - F_{WCLK} = the write-clock frequency of the memory
- P_{PLL} = P13 × F_{CLK}
  - F_{RefCLK} = the clock frequency of the clock input of the PLL
  - F_{CLK} = the clock frequency of the first clock output of the PLL

2.1.3 Power Estimation Example

This example employs an AX1000 shift-register design with 1,080 R-cells, one C-cell, one reset input, and one LVTTL 12 mA output, with high slew.

This design uses one HCLK at 100 MHz.

The following shows the example of power estimation.

- ms = 1,080 (in a shift register—100% of R-cells are toggling at each clock cycle)
- Fs = 100 MHz
- s = 1080
  => P_{HCLK} = (P1 + P2 × s + P3 × sqrt[s]) × Fs = 79 mW
  and Fs = 100 MHz
  => $P_{R\text{-}cells}$ = P7 × ms × Fs = 173 mW
- mc = 1 (1 C-cell in this shift-register)
  and Fs = 100 MHz
  => $P_{C\text{-}cells}$ = P8 × mc × Fs = 0.14 mW
- F_{pi} ~ 0 MHz
  and pi = 1 (1 reset input => this is why Fpi = 0)
  => P_{inputs} = P9 × pi × F_{pi} = 0 mW
- F_{po} = 50 MHz

and po = 1

=> $P_{outputs}$ = PI/O × po × F_{po} = 27.10 mW

- No RAM/FIFO in this shift-register
  => P_{memory} = 0 mW
- No PLL in this shift-register
  => P_{PLL} = 0 mW
- P_{ac} = P_{HCLK} + P_{CLK} + $P_{R\text{-}cells}$ + $P_{C\text{-}cells}$ + P_{inputs} + $P_{outputs}$ + P_{memory} + P_{PLL} = 276 mW
- P_{dc} = 7.5 mA × 1.5V = 11.25 mW
- P_{total} = P_{dc} + P_{ac} = 11.25 mW + 276 mW = 290.30 mW

2.2 Thermal Characteristics

The temperature variable in Microchip's Designer software refers to the junction temperature, but not to the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature. The following equation can be used to calculate junction temperature.

T_J = Junction Temperature = ΔT + T_a

Where,

T_a = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient

ΔT = θja × P

Where,

P = Power

θja = Junction to ambient of package.

θja numbers are located in Table 2-6

2.2.1 Package Thermal Characteristics

The device junction-to-case thermal characteristic is θjc, and the junction-to-ambient air characteristic is θja. The thermal characteristics for θja are shown with two different air flow rates. θjc values are provided for reference. The absolute maximum junction temperature is 125 °C.

The maximum power dissipation allowed for commercial and industrial grade devices is a function of θja. A sample calculation of the absolute maximum power dissipation allowed for an 896-pin FBGA package at commercial temperature and still air is as follows:

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (°C)} - \text{Max. ambient temp. (°C)}}{\theta_{ja}(\text{°C/W})} = \frac{125\text{°C} - 70\text{°C}}{13.6\text{°C/W}} = 4.04\ \text{W}$$

The maximum power dissipation allowed for military temperature and Mil-Std 883B devices is specified as a function of θjc.

The following table lists the package thermal characteristics.

Table 2-6. Package Thermal Characteristics

Package Type	Pin Count	θjc	θja Still Air	θja 1.0m/s	θja 2.5m/s	Units
Chip Scale Package (CSP)	180	N/A	57.8	51.0	50	°C/W
Plastic Quad Flat Pack (PQFP)	208	8.0	26	23.5	20.9	°C/W
Plastic Ball Grid Array (PBGA)	729	2.2	13.7	10.6	9.6	°C/W

.....continued						
Package Type	Pin Count	θjc	θja Still Air	θja 1.0m/s	θja 2.5m/s	Units
Fine Pitch Ball Grid Array (FBGA)	256	3.0	26.6	22.8	21.5	°C/W
Fine Pitch Ball Grid Array (FBGA)	324	3.0	25.8	22.1	20.9	°C/W
Fine Pitch Ball Grid Array (FBGA)	484	3.2	20.5	17.0	15.9	°C/W
Fine Pitch Ball Grid Array (FBGA)	676	3.2	16.4	13.0	12.0	°C/W
Fine Pitch Ball Grid Array (FBGA)	896	2.4	13.6	10.4	9.4	°C/W
Fine Pitch Ball Grid Array (FBGA)	1152	1.8	12.0	8.9	7.9	°C/W
Ceramic Quad Flat Pack (CQFP)[1]	208	2.0	22	19.8	18.0	°C/W
Ceramic Quad Flat Pack (CQFP)[1]	352	2.0	17.9	16.1	14.7	°C/W
Ceramic Column Grid Array (CCGA)[2]	624	6.5	8.9	8.5	8	°C/W

Notes:

1. θjc for the 208-pin and 352-pin CQFP refers to the thermal resistance between the junction and the bottom of the package.
2. θjc for the 624-pin CCGA refers to the thermal resistance between the junction and the top surface of the package. Thermal resistance from junction to board (θjb) for CCGA 624 package is 3.4 °C/W.

2.2.2 Timing Characteristics

Axcelerator devices are manufactured in a CMOS process. Therefore, device performance varies according to temperature, voltage, and process variations. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing. The derating factors shown in the following table should be applied to all timing data within this datasheet.

Table 2-7. Temperature and Voltage Timing Derating Factors (Normalized to Worst-Case Commercial, T_J = 70 °C, VCCA = 1.425V)

VCCA	Junction Temperature						
	–55 °C	–40 °C	0 °C	25 °C	70 °C	85 °C	125 °C
1.4V	0.83	0.86	0.91	0.96	1.02	1.05	1.15
1.425V	0.82	0.84	0.90	0.94	**1.00**	1.04	1.13
1.5V	0.78	0.80	0.85	0.89	0.95	0.98	1.07
1.575V	0.74	0.76	0.81	0.85	0.90	0.94	1.02
1.6V	0.73	0.75	0.80	0.84	0.89	0.92	1.01

Notes:

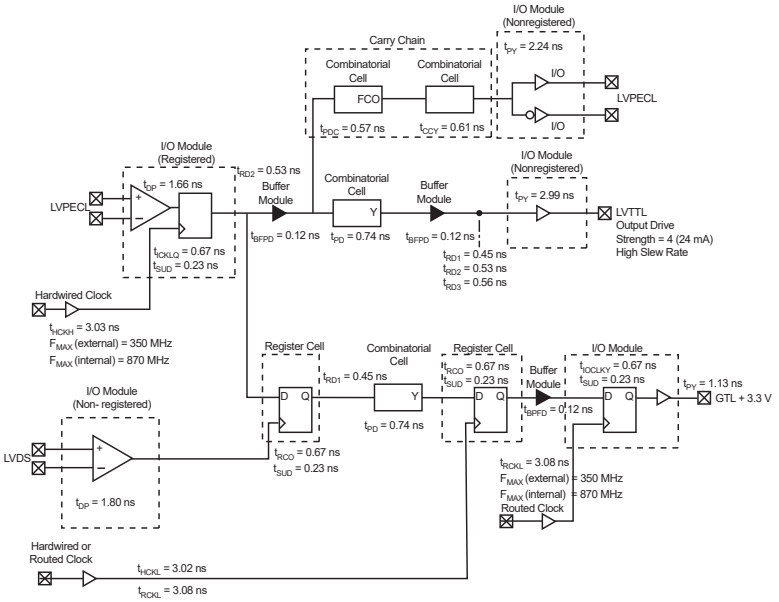
- The user can set the junction temperature in Designer software to any integer value in the range of –55 °C to 125 °C.
- The user can set the core voltage in Designer software to any value between 1.4V and 1.6V.

All timing numbers listed in this datasheet represent sample timing characteristics of Axcelerator devices. Actual timing delay values are design-specific and can be derived from the Timer tool in Microchip's Designer software after place-and-route.

2.2.3 Timing Model

The following figure shows the worst case timing data.

Figure 2-1. Worst Case Timing Data



2.2.3.1 Hardwired Clock—Using LVTTL 24 mA High Slew Clock I/O

- External Setup
  = (t_{DP} + t_{RD2} + t_{SUD}) – t_{HCKL}
  = (1.72 + 0.53 + 0.23) – 3.02 = –0.54 ns
- Clock-to-Out (Pad-to-Pad)
  = t_{HCKL} + t_{RCO} + t_{RD1} + t_{PY}
  = 3.02 + 0.67 + 0.45 + 2.99 = 7.13 ns

2.2.3.2 Routed Clock—Using LVTTL 24 mA High Slew Clock I/O

- External Setup
  = (t_{DP} + t_{RD2} + t_{SUD}) – t_{RCKH}
  = (1.72 + 0.53 + 0.23) – 3.13 = –0.65 ns
- Clock-to-Out (Pad-to-Pad)
  = t_{RCKH} + t_{RCO} + t_{RD1} + t_{PY}
  = 3.13 + 0.67 + 0.45 + 3.03 = 7.24 ns

2.3 I/O Specifications

2.3.1 Pin Descriptions

This section describes the pin descriptions.

2.3.1.1 Supply Pins

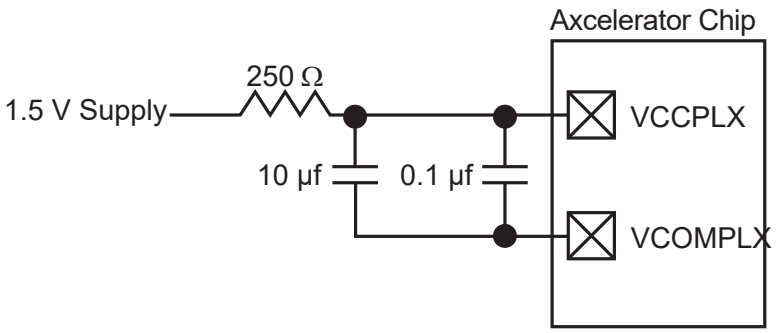
The following table lists the supply pins.

Table 2-8. Supply Pins

Name	Type	Description
GND	Ground	Low supply voltage
VCCA	Supply voltage	Supply voltage for array (1.5V). See Operating Conditions for more information.

.....continued		
Name	**Type**	**Description**
VCCIBx	Supply voltage	Supply voltage for I/Os. Bx is the I/O Bank ID—0 to 7. See Operating Conditions for more information.
VCCDA	Supply voltage	Supply voltage for the I/O differential amplifier and JTAG and probe interfaces. See Operating Conditions for more information. VCCDA should be tied to 3.3V.
VCCPLA/B/C/D/E/F/G/H	Supply voltage	PLL analog power supply (1.5V) for internal PLL. There are eight in each device. VCCPLA supports the PLL associated with global resource HCLKA, VCCPLB supports the PLL associated with global resource HCLKB, and so on. The PLL analog power supply pins should be connected to 1.5V whether PLL is used or not.
VCOMPLA/B/C/D/E/F/G/H	Supply voltage	Compensation reference signals for internal PLL. There are eight in each device. VCOMPLA supports the PLL associated with global resource HCLKA, VCOMPLE supports the PLL associated with global resource CLKE, and so on. (see the following figure for correct external connection to the supply). The VCOMPLX pins should be left floating if PLL is not used.
VPUMP	Supply voltage (external pump)	In the low power mode, VPUMP will be used to access an external charge pump (if the user desires to bypass the internal charge pump to further reduce power). The device starts using the external charge pump when the voltage level on VPUMP reaches VIH[1]. In normal device operation, when using the internal charge pump, VPUMP should be tied to GND.

Figure 2-2. VCCPLX and VCOMPLX Power Supply Connect



2.3.1.2 User-Defined Supply Pins

The following table lists the user-defined supply pins.

[1] When VPUMP = VIH, it shuts off the internal charge pump. See Low Power Mode

Table 2-9. User-Defined Supply Pins

Name	Type	Description
VREF	Supply voltage	Reference voltage for I/O banks. VREF pins are configured by the user from regular I/O pins, VREF pins are not in fixed locations. There can be one or more VREF pins in an I/O bank.

2.3.1.3 Global Pins

The following table lists the global pins.

Table 2-10. Global Pins

Name	Type	Description
HCLKA/B/C/D	Dedicated (hardwired) clocks A, B, C, and D	These pins are the clock inputs for sequential modules or north PLLs. Input levels are compatible with all supported I/O standards. There is a P/N pin pair for support of differential I/O standards. Single-ended clock I/Os can only be assigned to the P side of a paired I/O. This input is directly wired to each R-cell and offers clock speeds independent of the number of R-cells being driven. When the HCLK pins are unused, it is recommended that they are tied to ground.
CLKE/F/G/H	Routed clocks E, F, G, and H	These pins are clock inputs for clock distribution networks or south PLLs. Input levels are compatible with all supported I/O standards. There is a P/N pin pair for support of differential I/O standards. Single-ended clock I/Os can only be assigned to the P side of a paired I/O. The clock input is buffered prior to clocking the R-cells. When the CLK pins are unused, Microchip recommends to tie the CLK pins to the ground.

2.3.1.4 JTAG/Probe Pins

The following table lists the JTAG/Probe pins.

Table 2-11. JTAG/Probe Pins

Name	Type	Description
PRA/B/C/D	Probe A, B, C, and D	The Probe pins are used to output data from any user-defined design node within the device (controlled with Silicon Explorer II). These independent diagnostic pins can be used to allow real-time diagnostic output of any signal path within the device. The pins' probe capabilities can be permanently disabled to protect programmed design confidentiality. The probe pins are of LVTTL output levels.
TCK	Test clock	Test clock input for JTAG boundary-scan testing and diagnostic probe (Silicon Explorer II).

.....continued		
Name	**Type**	**Description**
TDI	Test data input	Serial input for JTAG boundary-scan testing and diagnostic probe. TDI is equipped with an internal 10 kΩ pull-up resistor.
TDO	Test data output	Serial output for JTAG boundary-scan testing.
TMS	Test mode select	The TMS pin controls the use of the IEEE 1149.1 boundary-scan pins (TCK, TDI, TDO, and TRST). TMS is equipped with an internal 10 kΩ pull-up resistor.
TRST	Boundary scan reset pin	The TRST pin functions as an active-low input to asynchronously initialize or reset the boundary scan circuit. The TRST pin is equipped with a 10 kΩ pull-up resistor.

2.3.1.5 Special Functions

The following table lists the special functions.

Table 2-12. Special Functions

Name	Type	Description
LP	Low power pin	The LP pin controls the low power mode of Axcelerator devices. The device is placed in the low power mode by connecting the LP pin to logic high. To exit the low power mode, the LP pin must be set Low. Additionally, the LP pin must be set Low during chip powering-up or chip powering-down operations. See Low Power Mode for more details.
NC	No connection	This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

2.3.2 User I/Os[2]

The Axcelerator family features a flexible I/O structure, supporting a range of mixed voltages (1.5V, 1.8V, 2.5V, and 3.3V) with its bank-selectable I/Os.

Each I/O provides programmable slew rates, drive strengths, and weak pull-up and weak pull-down circuits. The slew rate setting is effective for both rising and falling edges.

I/O standards, except 3.3V PCI and 3.3V PCI-X, are capable of hot insertion. 3.3V PCI and 3.3V PCI- X are 5V tolerant with the aid of an external resistor.

The input buffer has an optional user-configurable delay element. The element can reduce or eliminate thehold time requirement for input signals registered within the I/O cell. The value for the delay is set on a bank-wide basis. The delay Will be a function of process variations as well as temperature and voltage changes.

[2] Do not use an external resister to pull the I/O above VCCI for a higher logic “1” voltage level. The desired higher logic “1” voltage level will be degraded due to a small I/O current, which exists when the I/O is pulled up above VCCI.

Each I/O includes three registers: an input (InReg), an output (OutReg), and an enable register (EnReg). I/Os are organized into banks, and there are eight banks per device—two per side (see Figure 2-6). Each I/O bank has a common VCCI, the supply voltage for its I/Os.

For voltage-referenced I/Os, each bank also has a common reference-voltage bus, VREF. While VREF must have a common voltage for an entire I/O bank, its location is user-selectable. In other words, any user I/O in the bank can be selected to be a VREF.

The location of the VREF pin should be selected according to the following rules.

- Any pin that is assigned as a VREF can control a maximum of eight user I/O pad locations in each direction (16 total maximum) within the same I/O bank
- I/O pad locations listed as no connects are counted as part of the 16 maximum. In many cases, thisleads to fewer than eight user I/O package pins in each direction being controlled by a VREF pin.
- Dedicated I/O pins such as GND and VCCI are counted as part of the 16
- The two user I/O pads immediately adjacent on each side of the VREF pin (four in total) may only be used as inputs. The exception is when there is a VCCI/GND pair separating the VREF pin and the user I/O pad location.
- The user does not need to assign VREF pins for OUTBUF and TRIBUF. VREF pins are needed only for input and bidirectional I/Os.

The differential amplifier supply voltage VCCDA should be connected to 3.3V. A user can gain access to the various I/O standards in three ways.

- Instantiate specific library macros that represent the desired specific standard
- Use generic I/O macros and then use Designer's PinEditor to specify the desired I/O standards (this is not applicable to differential standards)
- A combination of the first two methods

For more details, see the I/O Features in Axcelerator Family Devices application note and the Antifuse Macro Library Guide .

Table 2-13. I/O Standards Supported by the Axcelerator Family

I/O Standard	Input/Output Supply Voltage (VCCI)	Input Reference Voltage (VREF)	Board Termination Voltage (VTT)
LVTTL	3.3	N/A	N/A
LVCMOS 2.5V	2.5	N/A	N/A
LVCMOS 1.8V	1.8	N/A	N/A
LVCMOS 1.5V (JDEC8-11)	1.5	N/A	N/A
3.3V PCI/PCI-X	3.3	N/A	N/A
GTL+ 3.3V	3.3	1.0	1.2
GTL+ 2.5V[1]	2.5	1.0	1.2
HSTL Class 1	1.5	0.75	0.75
SSTL3 Class 1 and II	3.3	1.5	1.5
SSTL2 Class1 and II	2.5	1.25	1.25
LVDS	2.5	N/A	N/A
LVPECL	3.3	N/A	N/A

Note:

1. 2.5V GTL+ is not supported across the full military temperature range.

Table 2-14. Supply Voltages

VCCA	VCCI	Input Tolerance	Output Drive Level
1.5V	1.5V	3.3V	1.5V
1.5V	1.8V	3.3V	1.8V
1.5V	2.5V	3.3V	2.5V
1.5V	3.3V	3.3V	3.3V

The following table compares the features of the different I/O standards.

Table 2-15. I/OFeatures Comparison

I/O Assignment	Clamp Diode	Hot Insertion	5V Tolerance	Input Buffer	Output Buffer
LVTTL	No	Yes	Yes[1]	Enabled/Disabled	
3.3V PCI, 3.3V PCI-X	Yes	No	Yes[1], [2]	Enabled/Disabled	
LVCMOS 2.5V	No	Yes	No	Enabled/Disabled	
LVCMOS 1.8V	No	Yes	No	Enabled/Disabled	
LVCMOS 1.5V (JESD8-11)	No	Yes	No	Enabled/Disabled	
Voltage-referenced input buffer	No	Yes	No	Enabled/Disabled	
Differential, LVDS/LVPECL, input	No	Yes	No	Enabled	Disabled[3]
Differential, LVDS/LVPECL, output	No	Yes	No	Disabled	Enabled[4]

Notes:

1. Can be implemented with an IDT bus switch.
2. Can be implemented with an external resistor.
3. The OE input of the output buffer must be deasserted permanently (handled by software).
4. The OE input of the output buffer must be asserted permanently (handled by software).

2.3.2.1 5V Tolerance

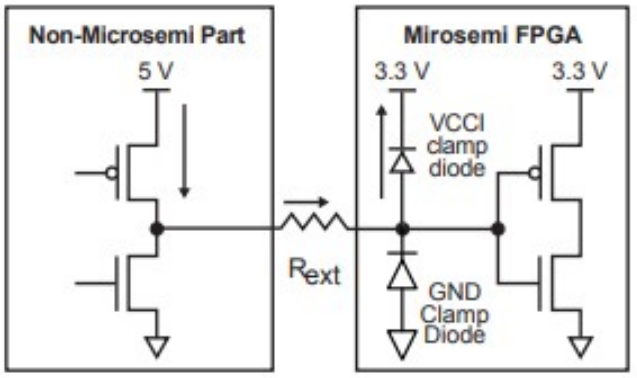
There are two schemes to achieve 5V tolerance.

3.3V PCI and 3.3V PCI-X are the only I/O standards that directly allow 5V tolerance. To implement this, an internal clamp diode between the input pad and the VCCI pad is enabled so that the voltage at the input pin is clamped, as shown in the following equation:

V_{input} = VCCI + V_{diode} = 3.3V + 0.7V = 4.0V

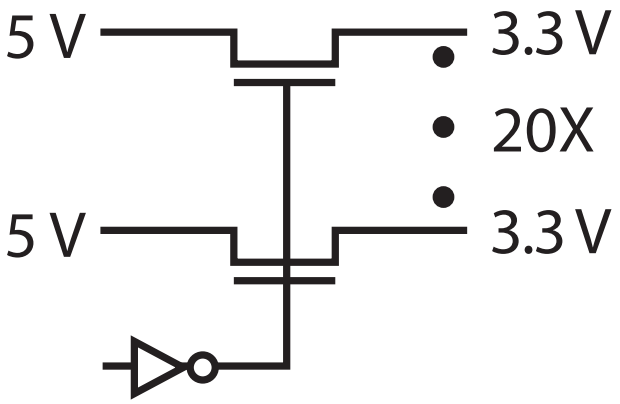
The internal VCCI clamp diode is only enabled while the device is powered on, so the voltage at the input will not be clamped if the VCCI or VCCA are powered off. An external series resistor (~100 ?) is required between the input pin and the 5V signal source to limit the current to less than 20 mA (see the following figure). The 100 ? resistor was chosen to meet the input Tr/Tf requirement (see Table 2-24). The GND clamp diode is available for all I/O standards and always enabled.

Figure 2-3. Use of an External Resistor for 5V Tolerance



5V tolerance can also be achieved with 3.3V I/O standards (3.3V PCI, 3.3V PCI-X, and LVTTL) using a bus-switch product (for example, IDTQS32X2384). This will convert the 5V signal to a 3.3V signal with minimum delay (see the following figure).

Figure 2-4. Bus Switch IDTQS32X2384



2.3.2.2 Simultaneous Switching Outputs (SSO)

When multiple output drivers switch simultaneously, they induce a voltage drop in the chip/package power distribution. This simultaneous switching momentarily raises the ground voltage within the device relative to the system ground. This apparent shift in the ground potential to a non-zero value is known as Simultaneous Switching Noise (SSN) or more commonly, ground bounce.

SSN becomes more of an issue in high pin count packages and when using high performance devices such as the Axcelerator family. Based upon testing, Microchip recommends users not to exceed eight Simultaneous Switching Outputs (SSO) per each VCCI/GND pair. To ease this potential burden on designers, Microchip has designed all of the Axcelerator BGAs[3] to not exceed this limit with the exception of the CS180, which has an I/O to VCCI/GND pair ratio of nine to one.

For more information, see the Simultaneous Switching Noise and Signal Integrity application note.

2.3.3 I/O Banks and Compatibility

Since each I/O bank has its own user-assigned input reference voltage (VREF) and an input/output supply voltage (VCCI), only I/Os with compatible standards can be assigned to the same bank.

[3] The user should note that in Bank 8 of both AX1000-FG484 and AX500-FG484, there are local violations of this 8:1 ratio.

The following table shows the compatible I/O standards for a common VREF (for voltage-referenced standards).

Table 2-16. Compatible I/O Standards for Different VREF Values

VREF	Compatible Standards
1.5V	SSTL 3 (Class I and II)
1.25V	SSTL 2 (Class I and II)
1.0V	GTL+ (2.5V and 3.3V Outputs)
0.75V	HSTL (Class I)

The following table shows compatible standards for a common VCCI.

Table 2-17. Compatible I/O Standards for Different VCCI Values

VCCI[1]	Compatible Standards	VREF
3.3V	LVTTL, PCI, PCI-X, LVPECL, GTL+ 3.3V	1.0
3.3V	SSTL 3 (Class I and II), LVTTL, PCI, LVPECL	1.5
2.5V	LVCMOS 2.5V, GTL+ 2.5V, LVDS[2]	1.0
2.5V	LVCMOS 2.5V, SSTL 2 (Classes I and II), LVDS[2]	1.25
1.8V	LVCMOS 1.8V	N/A
1.5V	LVCMOS 1.5V, HSTL Class I	0.75

Notes:

1. VCCI is used for both inputs and outputs
2. VCCI tolerance is ±5%

The following table summarizes the different combinations of voltages and I/O standards that can be used together in the same I/O bank.

Table 2-18. Legal I/O Usage Matrix

I/O Standard	LVTTL 3.3V	LVCMOS 2.5V	LVCMOS 1.8V	LVCMOS 1.5V (JESD8-11)	3.3V PCI/ PCI-X	GTL+ (3.3V)	GTL+ (2.5V)	HSTL Class I (1. 5V)	SSTL2 Class I & II (2.5V)	SSTL3 Class I & II (3.3V)	LVDS (2.5V)	LVPECL (3.3V)

LVDS (VREF = 1.0V)	—	✓	—	—	—	—	✓	—	—	—	✓	—
LVDS (VREF = 1.25V)	—	✓	—	—	—	—	—	—	✓	—	✓	—
LVPECL (VREF = 1.0V)	✓	—	—	—	✓	✓	—	—	—	—	—	✓
LVPECL (VREF = 1.5V)	✓	—	—	—	✓	—	—	—	—	✓	—	✓

Notes:
The GTL+ 2.5V is not supported across the full military temperature range.

A tick symbol indicates whether standards can be used within a bank at the same time
Examples:

- LVTTL can be used with 3.3V PCI and GTL+ (3.3V), when VREF = 1.0V (GTL+ requirement).
- LVTTL can be used with 3.3V PCI and SSTL3 Class I and II, when VREF = 1.5V (SSTL3 requirement).

The two I/O standards are compatible if:

- Their VCCI values are identical
- Their VREF standards are identical (if applicable)

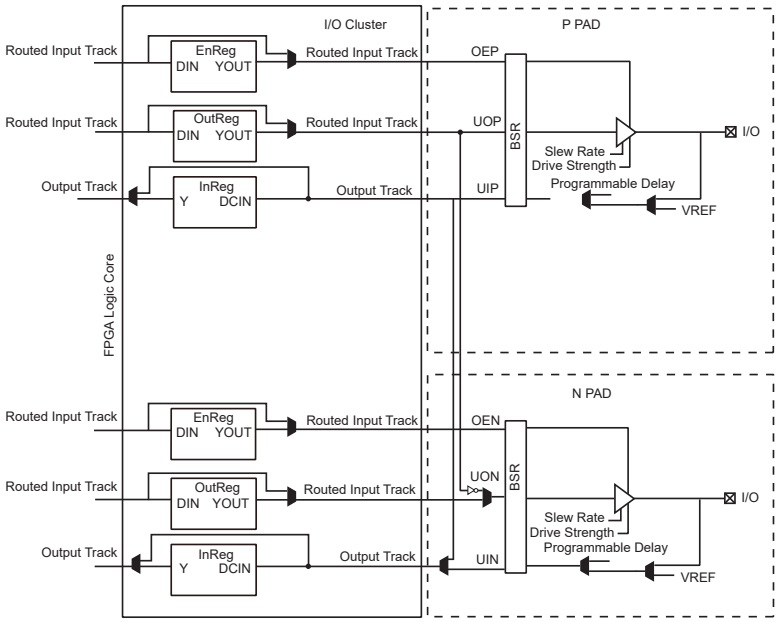
For example, if LVTTL 3.3V (VREF= 1.0V) is used, then the other available (that is compatible) I/O standards in the same bank are LVTTL 3.3V PCI/PCI-X, GTL+, and LVPECL.

Also, when multiple I/O standards are used within a bank, the voltage tolerance will be limited to the minimum tolerance of all I/O standards used in the bank.

2.3.3.1 I/O Clusters

Each I/O cluster incorporates two I/O modules, four RX modules, two TX modules, and a buffer module. In turn, each I/O module contains one Input Register (InReg), one Output Register (OutReg), and one Enable Register (EnReg) (see the following figure).

Figure 2-5. I/O Cluster Interface



2.3.3.2 Using an I/O Register

To access the I/O registers, registers must be instantiated in the netlist and then connected to the I/Os. Usage of each I/O register (register combining) is individually controlled and can be selected/deselected using the PinEditor tool in the Designer software. I/O register combining can also be controlled at the device level, affecting all I/Os. The I/O register option is deselected by default in any given design.[4]

In addition, Designer software provides a global option to enable/disable the usage of registers in the I/Os. This option is design-specific. The setting for each individual I/O overrides this global option. Furthermore, the global set fuse option in the Designer software, when checked, causes all I/O registers to output logic High at device power-up.

2.3.3.3 Using the Weak Pull-Up and Pull-Down Circuits

Each Axcelerator I/O comes with a weak pull-up/down circuit (on the order of 10 kΩ). These are weak transistors with the gates tied on, so the resistance of the transistor emulates a resistor. The weak pull-up and pull-down is active only when the device is powered up, and they must be biased to be on. When the rails are coming up, they are not biased fully, so they do not behave as resistors until the voltage is at sufficient levels to bias the transistors. The key is they really are transistors, they are not traces of poly silicon, which is another way to do an on-chip resistor (those take much more room). I/O macros are provided for combinations of pull up/down for LVTTL, LVCMOS (2.5V, 1.8V, and 1.5V) standards. These macros can be instantiated if a keeper circuit for any input buffer is required.

2.3.3.4 Customizing the I/O

A five-bit programmable input delay element is associated with each I/O. The value of this delay is set on a bank-wide basis (see the following table). It is optional for each input buffer within the bank (that is, the user can enable or disable the delay element for the I/O). When the input buffer drives a register within the I/O, the delay element is activated by default to ensure a zero hold-time. The default setting for this property can be set in Designer. When the input buffer does not drive a register, the delay element is deactivated to provide higher performance. Again, this can be overridden by changing the default setting for this property in Designer.

[4] Please note that register combining for multi fanout nets is not supported.

The slew-rate value for the LVTTL output buffer can be programmed and can be set to either slow or fast.

The drive strength value for LVTTL output buffers can be programmed as well. There are four different drive strength values (8 mA, 12 mA, 16 mA, or 24 mA) that can be specified in Designer.[5]

The following table lists the values of bank-wide delay.

Table 2-19. Bank-Wide Delay Values

Bits Setting	Delay (ns)
0	0.54
1	0.65
2	0.71
3	0.83
4	0.9
5	1.01
6	1.08
7	1.19
8	1.27
9	1.39
10	1.45
11	1.56
12	1.64
13	1.75
14	1.81
15	1.93
16	2.01
17	2.13
18	2.19
19	2.3
20	2.38
21	2.49
22	2.55
23	2.67
24	2.75
25	2.87
26	2.93
27	3.04
28	3.12
29	3.23
30	3.29
31	3.41

Note: Delay values are approximate and will vary with process, temperature, and voltage.

2.3.3.5 Using the Differential I/O Standards

Differential I/O macros should be instantiated in the netlist. The settings for these I/O standards cannot be changed inside Designer. Note that there are no tristated or bidirectional I/O buffers for differential standards.

[5] These values are minimum drive strengths.

2.3.3.6 Using the Voltage-Referenced I/O Standards

Using these I/O standards is similar to that of single-ended I/O standards. Their settings can be changed in Designer.

2.3.3.7 Using Double Data Rate (DDR)

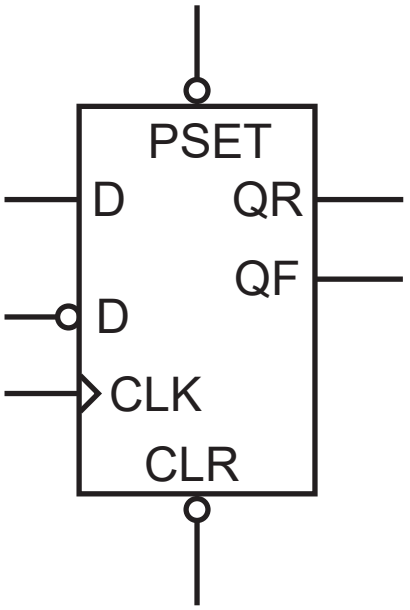
In Double Data Rate mode, new data is present on every transition of the clock signal. Clock and data lines have identical bandwidth and signal integrity requirements, making it very efficient for implementing very high-speed systems.

To implement a DDR, users need to:

- Instantiate an input buffer (with the required I/O standard).
- Instantiate the DDR_REG macro (see the following figure).
- Connect the output from the input buffer to the input of the DDR macro.

The following figure shows DDR register.

Figure 2-6. DDR Register



2.3.3.8 Macros for Specific I/O Standards

There are different macro types for any I/O standard or feature that determine the required VCCI and VREF voltages for an I/O. The generic buffer macros require the LVTTL standard with slow slew rate and 24 mA-drive strength. LVTTL can support high slew rate but this should only be used for critical signals.

Most of the macro symbols represent variations of the six generic symbol types:

- CLKBUF: Clock Buffer
- HCLKBUF: Hardwired Clock Buffer
- INBUF: Input Buffer
- OUTBUF: Output Buffer
- TRIBUF: Tristate Buffer
- BIBUF: Bidirectional Buffer

Other macros include the following:

- Differential I/O standard macros: The LVDS and LVPECL macros either have a pair of differential inputs (for example, INBUF_LVDS) or a pair of differential outputs (for example, OUTBUF_LVPECL).
- Pull-up and pull-down variations of the INBUF, BIBUF, and TRIBUF macros. These are available only with TTL and LVCMOS thresholds. They can be used to model the behavior of the pull-up and pull-down resistors available in the architecture. Whenever an input pin is left unconnected, the output pin will either go high or low rather than unknown. This allows users to leave inputs unconnected without having the negative effect on simulation of propagating unknowns.
- DDR_REG macro. It can be connected to any I/O standard input buffers (that is, INBUF) to implement a double data rate register. Designer software will map it to the I/O module in the same way it maps the other registers to the I/O module.

The followings tables list all the available macro names differentiated by I/O standard, type, slew rate, and drive strength.

Table 2-20. Macros for Single-Ended I/O Standards

Standard	VCCI	Macro Names
LVTTL	3.3V	CLKBUF, HCLKBUF INBUF, OUTBUF, OUTBUF_S_8, OUTBUF_S_12, OUTBUF_S_16, OUTBUF_S_24, OUTBUF_H_8, OUTBUF_H_12, OUTBUF_H_16, OUTBUF_H_24, TRIBUF, TRIBUF_S_8, TRIBUF_S_12, TRIBUF_S_16, TRIBUF_S_24, TRIBUF_H_8, TRIBUF_H_12, TRIBUF_H_16, TRIBUF_H_24, BIBUF, BIBUF_S_8, BIBUF_S_12, BIBUF_S_16, BIBUF_S_24, BIBUF_H_8, BIBUF_H_12, BIBUF_H_16, BIBUF_H_24
3.3V PCI	3.3V	CLKBUF_PCI, HCLKBUF_PCI, INBUF_PCI, OUTBUF_PCI, TRIBUF_PCI, BIBUF_PCI
3.3V PCI-X	3.3V	CLKBUF_PCI-X, HCLKBUF_PCI-X, INBUF_PCI-X, OUTBUF_PCI-X, TRIBUF_PCI-X, BIBUF_PCI-X
LVCMOS25	2.5V	CLKBUF_LVCMOS25, HCLKBUF_LVCMOS25, INBUF_LVCMOS25, OUTBUF_LVCMOS25, TRIBUF_LVCMOS25, BIBUF_LVCMOS25
LVCMOS18	1.8V	CLKBUF_LVCMOS18, HCLKBUF_LVCMOS18, INBUF_LVCMOS18, OUTBUF_LVCMOS18, TRIBUF_LVCMOS18, BIBUF_LVCMOS18
LVCMOS15 (JESD8-11)	1.5V	CLKBUF_LVCMOS15, HCLKBUF_LVCMOS15, INBUF_LVCMOS15, OUTBUF_LVCMOS15, TRIBUF_LVCMOS15, BIBUF_LVCMOS15

Table 2-21. I/O Macros for Differential I/O Standards

Standard	VCCI	Macro Names
LVPECL	3.3V	CLKBUF_LVPECL, HCLKBUF_LVPECL, INBUF_LVPECL, OUTBUF_LVPECL
LVDS	2.5V	CLKBUF_LVDS, HCLKBUF_LVDS, INBUF_LVDS, OUTBUF_LVDS

Table 2-22. I/O Macros for Voltage-Referenced I/O Standards

Standard	VCCI	VREF	Macro Names
GTL+	3.3V	1.0V	CLKBUF_GTP33, HCLKBUF_GTP33, INBUF_GTP33, OUTBUF_GTP33, TRIBUF_GTP33, BIBUF_GTP33
GTL+	2.5V	1.0V	CLKBUF_GTP25, HCLKBUF_GTP25, INBUF_GTP25, OUTBUF_GTP25, TRIBUF_GTP25, BIBUF_GTP25
SSTL2 Class I	2.5V	1.25V	CLKBUF_SSTL2_I, HCLKBUF_SSTL2_I, INBUF_SSTL2_I, OUTBUF_SSTL2_I, TRIBUF_SSTL2_I, BIBUF_SSTL2_I
SSTL2 Class II	2.5V	1.25V	CLKBUF_SSTL2_II, HCLKBUF_SSTL2_II, INBUF_SSTL2_II, OUTBUF_SSTL2_II, TRIBUF_SSTL2_II, BIBUF_SSTL2_II
SSTL3 Class I	3.3V	1.5V	CLKBUF_SSTL3_I, HCLKBUF_SSTL3_I, INBUF_SSTL3_I, OUTBUF_SSTL3_I, TRIBUF_SSTL3_I, BIBUF_SSTL3_I

.....continued			
Standard	**VCCI**	**VREF**	**Macro Names**
SSTL3 Class II	3.3V	1.5V	CLKBUF_SSTL3_II, HCLKBUF_SSTL3_II, INBUF_SSTL3_II, OUTBUF_SSTL3_II, TRIBUF_SSTL3_II, BIBUF_SSTL3_II
HSTL Class I	1.5V	0.75V	CLKBUF_HSTL_I, HCLKBUF_HSTL_I, INBUF_HSTL_I, OUTBUF_HSTL_I, TRIBUF_HSTL_I, BIBUF_HSTL_I

2.3.4 User I/O Naming Conventions

Due to the complex and flexible nature of the Axcelerator family's user I/Os, a naming scheme is used to show the details of the I/O. The naming scheme explains to which bank an I/O belongs, as well as the pairing and pin polarity for differential I/Os (see the following figures).

Figure 2-7. I/O Bank and Dedicated Pin Layout

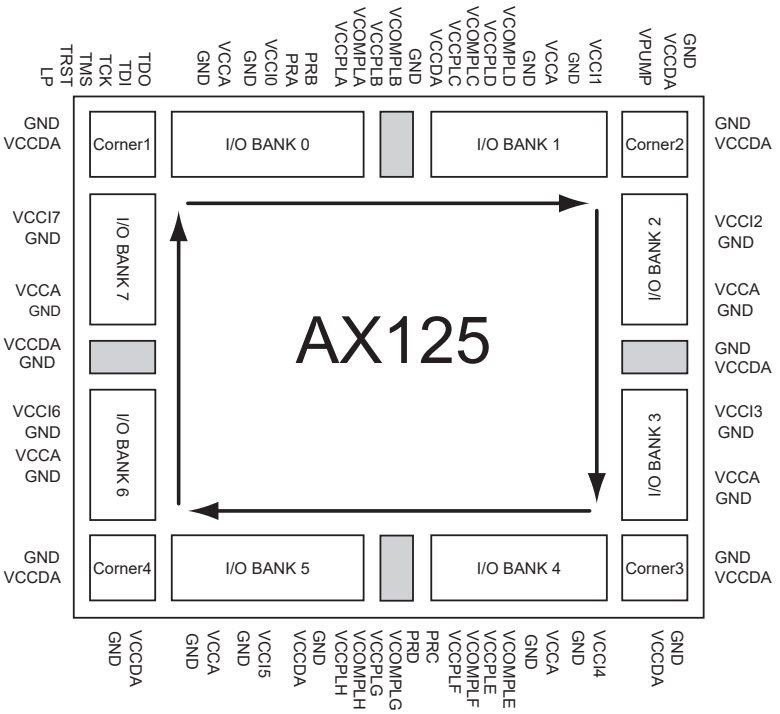


Figure 2-8. General Naming Schemes

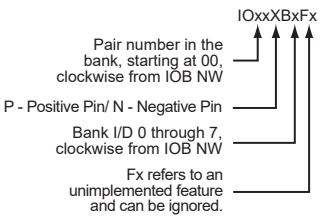

Examples:

IO12PB1F1 is the positive pin of the thirteenth pair of the first I/O bank (IOB NE). IO12PB1 combined with IO12NB1 form a differential pair.

For those I/Os that can be employed either as a user I/O or as a special function, the following nomenclature is used:

IOxxXBxFx/special_function_name

IOxxPB1Fx/xCLKx this pin can be configured as a clock input or as a user I/O.

2.3.5 I/O Standard Electrical Specifications

The following tables show the I/O standard electrical specifications.

Table 2-23. Input Capacitance

Symbol	Parameter	Conditions	Min.	Max.	Units
CIN	Input capacitance	VIN = 0, f = 1.0 MHz	—	10	pF
CINCLK	Input capacitance on HCLK and RCLK pin	VIN = 0, f = 1.0 MHz	—	10	pF

Table 2-24. I/O Input Rise Time and Fall Time[1]

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)
LVTTL	No requirement	50 ns
LVCMOS 2.5V	No requirement	50 ns
LVCMOS 1.8V	No requirement	50 ns
LVCMOS 1.5V	No requirement	50 ns
PCI	No requirement	50 ns
PCIX	No requirement	50 ns
GTL+	No requirement	50 ns
HSTL	No requirement	50 ns
SSTL2	No requirement	50 ns
HSTL3	No requirement	50 ns
LVDS	No requirement	50 ns
LVPECL	No requirement	50 ns

Note:

1. Input Rise/Fall time applies to all inputs, be it clock or data. Inputs have to ramp up/down linearly, in a monotonic way. Glitches or a plateau may cause double clocking. They must be avoided. For output rise/fall time, see the IBIS models for extraction.

The following figure shows the input and output buffer delays.

Figure 2-9. Input Buffer Delays

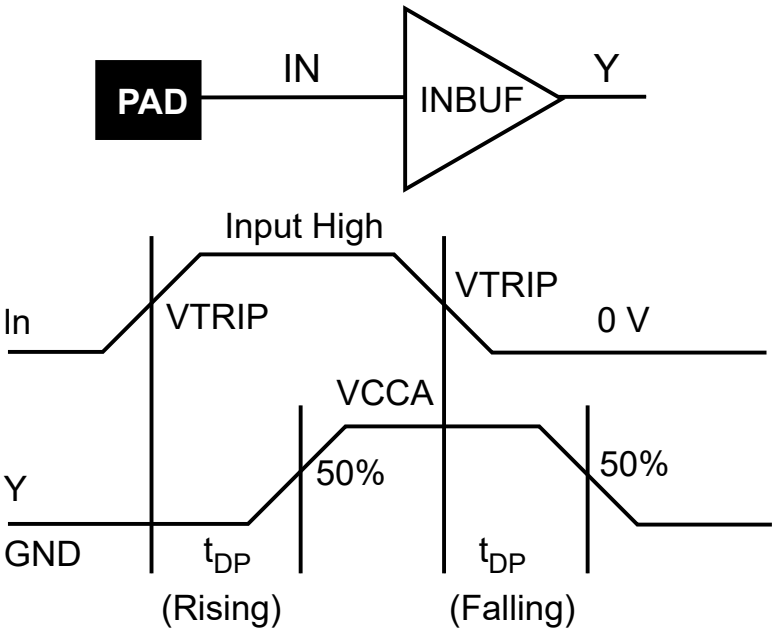

Figure 2-10. Output Buffer Delays

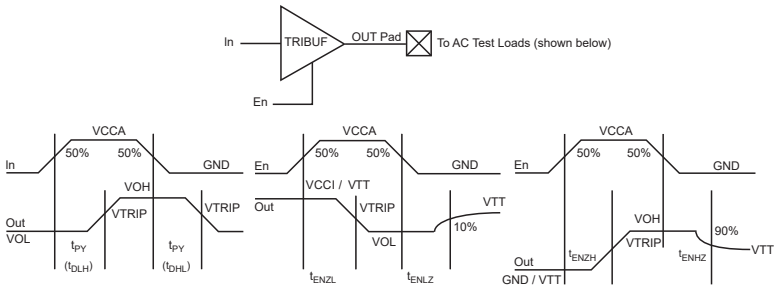

2.3.6 I/O Module Timing Characteristics

The following figure shows the timing model.

Figure 2-11. Timing Model

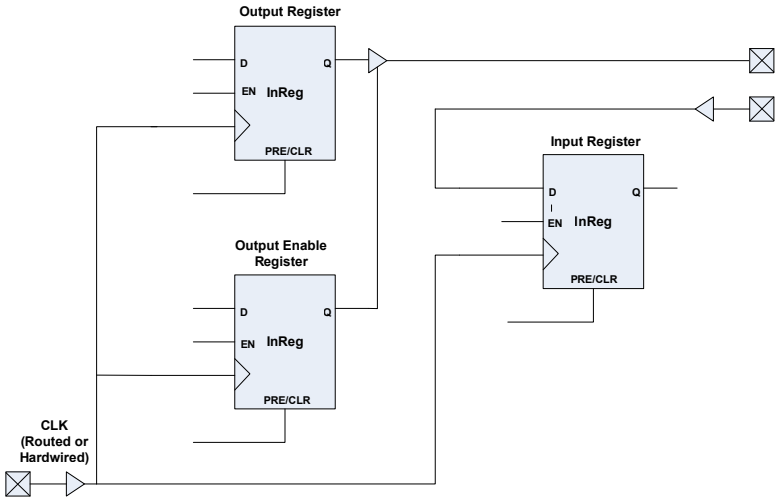

Figure 2-12. Input Register Timing Characteristics

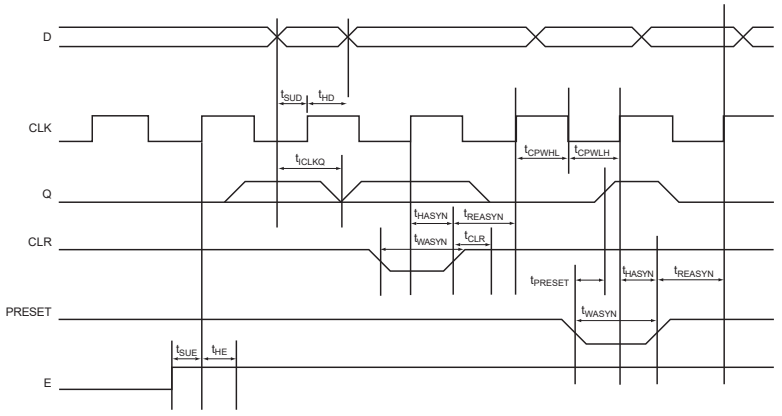

Figure 2-13. Output Register Timing Characteristics

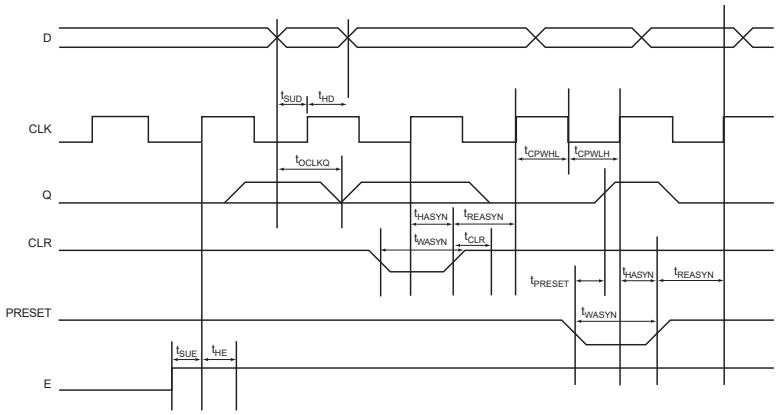

Figure 2-14. Output Enable Register Timing Characteristics

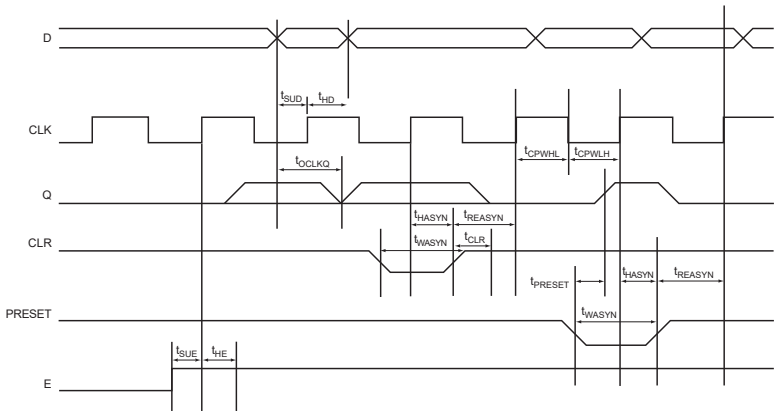


2.3.7 3.3V LVTTL

Low-Voltage Transistor-Transistor Logic (LVTTL) is a general purpose standard (EIA/JESD) for 3.3V applications. It uses an LVTTL input buffer and push-pull output buffer.

The following table lists the DC input and output levels of 3.3V LVTTL.

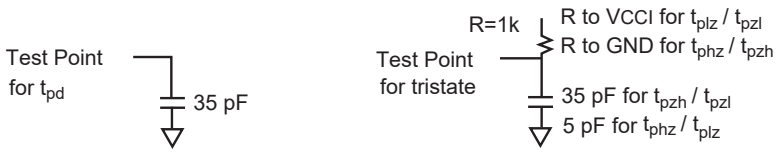
Table 2-25. DC Input and Output Levels

VIL		VIH		VOL	VOH	IOL	IOH
Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
–0.3	0.8	2.0	3.6	0.4	2.4	24	–24

2.3.7.1 AC Loadings

The following figure shows AC test loads.

Figure 2-15. AC Test Loads



The following table lists the AC loading values.

Table 2-26. AC Waveforms, Measuring Points, and Capacitive Load

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ) (V)	Cload (pF)
0	3.0	1.40	N/A	35

Note:

1. Measuring Point = VTRIP

2.3.7.2 Timing Characteristics

The following table lists the timing characterisitics of 3.3V LVTTL.

Table 2-27. 3.3V LVTTL I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

2.3.11 3.3V PCI, 3.3V PCI-X

Peripheral Component Interface (PCI) for 3.3V standard specifies support for both 33 MHz and 66 MHz PCI bus applications. It uses an LVTTL input buffer and a push-pull output buffer. The input and

output buffers are 5V tolerant with the aid of external components. Axcelerator 3.3V PCI and 3.3V PCI-X buffers are compliant with the PCI Local Bus Specification Rev. 2.1.

The PCI Compliance Specification requires the clamp diodes to be able to withstand for 11 ns, –3.5V in undershoot, and 7.1V in overshoot.

The following table lists the DC input and output levels of 3.3V PCI and 3.3V PCI-X.

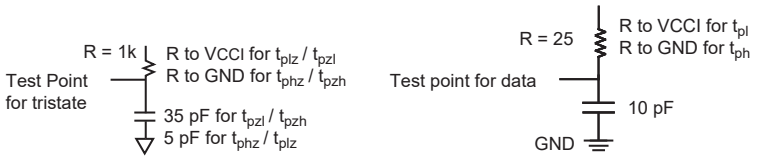
Table 2-37. DC Input and Output Levels

Standard	VIL		VIH		VOL	VOH	IOL	IOH
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
PCI	–0.3	0.3 VCCI	0.5 VCCI	VCCI + 0.5	(per PCI specification)			
PCI-X	–0.5	0.35 VCCI	0.5 VCCI	VCCI + 0.5	(per PCI specification)			

2.3.11.1 AC Loadings

The following figure shows AC test loads.

Figure 2-19. AC Test Loads



The following table lists the AC loading values.

Table 2-38. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ) (V)	Cload (pF)
(Per PCI Spec and PCI-X Spec)			N/A	10

Note:

1. Measuring Point = VTRIP

2.3.11.2 Timing Characteristics

The following table lists the timing characteristics of 3.3V PCI.

Table 2-39. 3.3V PCI I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
3.3V PCI Output Module Timing								
t_{DP}	Input buffer	—	1.57	—	1.79	—	2.10	ns
t_{PY}	Output buffer	—	1.91	—	2.18	—	2.56	ns

2.4 Voltage-Referenced I/O Standards

2.4.1 GTL+

Gunning Transceiver Logic Plus (GTL+) is a high-speed bus standard (JESD8-3). It requires a differential amplifier input buffer and an Open Drain output buffer. The VCCI pin should be connected to 2.5V or 3.3V. Note that 2.5V GTL+ is not supported across the full military temperature range.

The following table lists the DC input and output levels of GTL+.

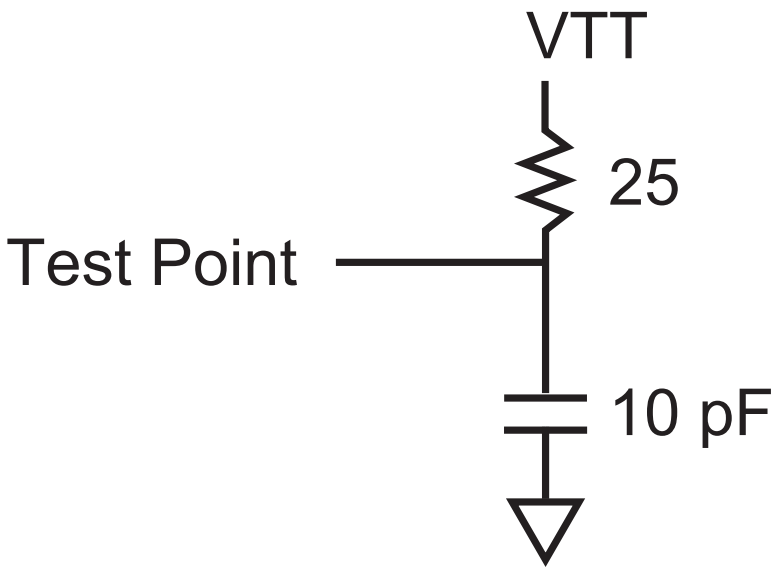
Table 2-41. DC Input and Output Levels

VIL		VIH		VOL	VOH	IOL	IOH
Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
N/A	VREF – 0.1	VREF + 0.1	N/A	0.6	NA	NA	NA

2.4.1.1 AC Loadings

The following figure shows AC test loads.

Figure 2-20. AC Test Loads



The following table lists the AC loading values.

Table 2-42. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ) (V)	Cload (pF)
VREF – 0.2	VREF + 0.2	VREF	1.0	10

Note:

1. Measuring Point = VTRIP

2.4.1.2 Timing Characteristics

The following table lists the timing characteristics of 2.5V GTL+.

Table 2-43. 2.5V GTL+ I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 2.3V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
2.5V GTL+ I/O Module Timing

t_{PRESET}	Asynchronous Preset-to-Q	—	0.23	—	0.27	—	0.31	ns

2.4.2 HSTL Class I

High-Speed Transceiver Logic (HSTL) is a general purpose high-speed 1.5V bus standard (EIA/JESD8-6). The Axcelerator devices support Class I. This requires a differential amplifier input buffer and a push-pull output buffer.

The following table lists the DC input and output levels of HSTL Class I.

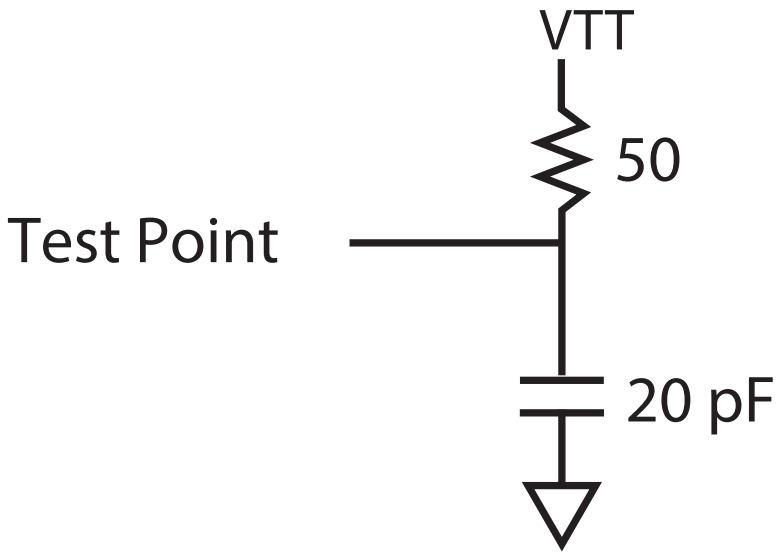
Table 2-45. DC Input and Output Levels

VIL		VIH		VOL	VOH	IOL	IOH
Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
–0.3	VREF – 0.1	VREF + 0.1	3.6	0.4	VCC – 0.4	8	–8

2.4.2.1 AC Loadings

The following figure shows AC test loads.

Figure 2-21. AC Test Loads



The following table lists the AC loading values.

Table 2-46. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ) (V)	Cload (pF)
VREF –0.5	VREF + 0.5	VREF	0.75	20

Note:

1. Measuring Point = VTRIP

2.4.2.2 Timing Characteristics

The following table lists the timing characteristics of 1.5V HSTL Class I.

Table 2-47. 1.5V HSTL Class I I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 1.425V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units

t_{CLR}	Asynchronous Clear-to-Q	—	0.23	—	0.27	—	0.31	ns
t_{PRESET}	Asynchronous Preset-to-Q	—	0.23	—	0.27	—	0.31	ns

2.4.3 SSTL2

Stub Series Terminated Logic (SSTL) for 2.5V is a general purpose 2.5V memory bus standard (JESD8-9). The Axcelerator devices support both classes of this standard. This requires a differential amplifier input buffer and a push-pull output buffer.

2.4.3.1 Class I

The following table lists the DC input and output levels of SSTL2 Class I.

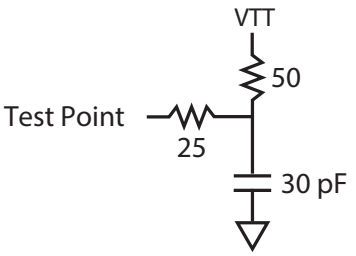
Table 2-48. DC Input and Output Levels

VIL		VIH		VOL	VOH	IOL	IOH
Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
–0.3	VREF – 0.2	VREF + 0.2	3.6	VREF – 0.57	VREF + 0.57	7.6	–7.6

2.4.3.1.1 AC Loadings

The following figure shows AC test loads.

Figure 2-22. AC Test Loads



The following table lists the AC loading values.

Table 2-49. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ) (V)	Cload (pF)
VREF – 0.75	VREF + 0.75	VREF	1.25	30

Note:

1. Measuring Point = VTRIP

2.4.3.1.2 Timing Characteristics

The following table lists the timing characteristics of 2.5V SSTL2 Class I.

Table 2-50. 2.5V SSTL2 Class I I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 2.3V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.

2.5 Differential Standards

2.5.1 Physical Implementation

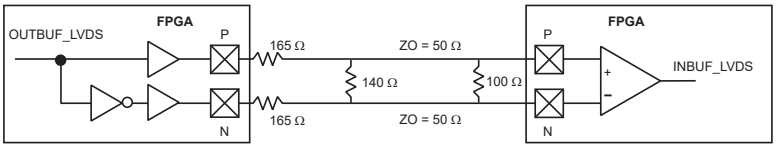
Implementing differential I/O standards requires the configuration of a pair of external I/O pads, resulting in a single internal signal. To facilitate construction of the differential pair, a single I/O Cluster contains the resources for a pair of I/Os. Configuration of the I/O Cluster as a differential pair is handled by Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

2.5.2 LVDS

Low-Voltage Differential Signal (LVDS) (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit is carried through two signal lines, so two pins are needed. It also requires an external resistor termination. The voltage swing between these two signal lines is approximately 350 mV.

Figure 2-26. LVDS Board-Level Implementation



The LVDS circuit consists of a differential driver connected to a terminated receiver through a constant-impedance transmission line. The receiver is a wide-common-mode-range differential amplifier. The common-mode range is from 0.2V to 2.2V for a differential input with 400 mV swing.

To implement the driver for the LVDS circuit, drivers from two adjacent I/O cells are used to generate the differential signals (note that the driver is not a current-mode driver). This driver provides a nominal constant current of 3.5 mA. When this current flows through a 100Ω termination resistor on the receiver side, a voltage swing of 350 mV is developed across the resistor. The direction of the current flow is controlled by the data fed to the driver.

An external-resistor network (three resistors) is needed to reduce the voltage swing to about 350 mV. Therefore, four external resistors are required, three for the driver and one for the receiver.

The following table lists the DC input and output levels of LVDS.

Table 2-60. DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI[1]	Supply voltage	2.375	2.5	2.625	V
VOH	Output high voltage	1.25	1.425	1.6	V
VOL	Output low voltage	0.9	1.075	1.25	V

.....continued					
DC Parameter	Description	Min.	Typ.	Max.	Units
VODIFF	Differential output voltage	250	350	450	mV
VOCM	Output common mode voltage	1.125	1.25	1.375	V
VICM2	Input common mode voltage	0.2	1.25	2.2	V

Notes:

1. ±5%
2. Differential input voltage = ±350 mV.

The following table lists the AC loading values.

Table 2-61. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)
1.2 – 0.125	1.2 + 0.125	1.2

Note:

1. Measuring Point = VTRIP

2.5.2.1 Timing Characteristics

The following table lists the timing characteristics of LVDS.

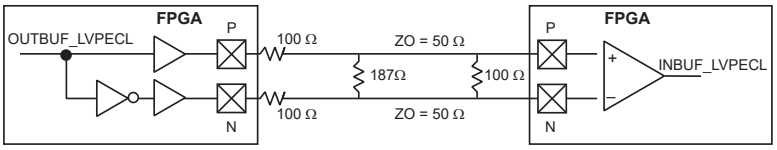
Table 2-62. LVDS I/O Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 2.3V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
LVDS Output Module Timing								
t_{DP}	Input buffer	—	1.80	—	2.05	—	2.41	ns
t_{PY}	Output buffer	—	2.32	—	2.64	—	3.11	ns
t_{ICLKQ}	Clock-to-Q for the I/O input register	—	0.67	—	0.77	—	0.90	ns
t_{OCLKQ}	Clock-to-Q for the I/O output register and the I/O enable register	—	0.67	—	0.77	—	0.90	ns
t_{SUD}	Data input set-up	—	0.23	—	0.27	—	0.31	ns
t_{SUE}	Enable input set-up	—	0.26	—	0.30	—	0.35	ns
t_{HD}	Data input hold	—	0.00	—	0.00	—	0.00	ns
t_{HE}	Enable input hold	—	0.00	—	0.00	—	0.00	ns
t_{CPWHL}	Clock pulse width high to low	0.39	—	0.39	—	0.39	—	ns
t_{CPWLH}	Clock pulse width low to high	0.39	—	0.39	—	0.39	—	ns
t_{WASYN}	Asynchronous pulse width	0.37	—	0.37	—	0.37	—	ns
t_{REASYN}	Asynchronous recovery time	—	0.13	—	0.15	—	0.17	ns
t_{HASYN}	Asynchronous removal time	—	0.00	—	0.00	—	0.00	ns
t_{CLR}	Asynchronous Clear-to-Q	—	0.23	—	0.27	—	0.31	ns
t_{PRESET}	Asynchronous Preset-to-Q	—	0.23	—	0.27	—	0.31	ns

2.5.3 LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit is carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination. The voltage swing between these two signal lines is approximately 850 mV.

Figure 2-27. LVPECL Board-Level Implementation



The LVPECL circuit is similar to the LVDS scheme. It requires four external resistors, three for the driver and one for the receiver. The values for the three driver resistors are different from that of LVDS since the output voltage levels are different. The VOH levels are 200 mV below the standard LVPECL levels.

The following table lists the DC input and output levels of LVPECL.

Table 2-63. DC Input and Output Levels

DC Parameter	Min.		Typ.		Max.		Units
	Min.	Max.	Min.	Max.	Min.	Max.	
VCCI	3		3.3		3.6		V
VOH	1.8	2.11	1.92	2.28	2.13	2.41	V
VOL	0.96	1.27	1.06	1.43	1.3	1.57	V
VIH	1.49	2.72	1.49	2.72	1.49	2.72	V
VIL	0.86	2.125	0.86	2.125	0.86	2.125	V
Differential input voltage	0.3		0.3		0.3		V

2.6 Module Specifications

2.6.1 C-Cell

The C-cell is one of the two logic module types in the AX architecture. It is the combinatorial logic resource in the Axcelerator device. The AX architecture implements a new combinatorial cell that is an extension of the C-cell implemented in the SX-A family. The main enhancement of the new C-cell is the addition of carry-chain logic.

The C-cell can be used in a carry-chain mode to construct arithmetic functions. If carry-chain logic is not required, it can be disabled.

The following is the list of C-cell features.

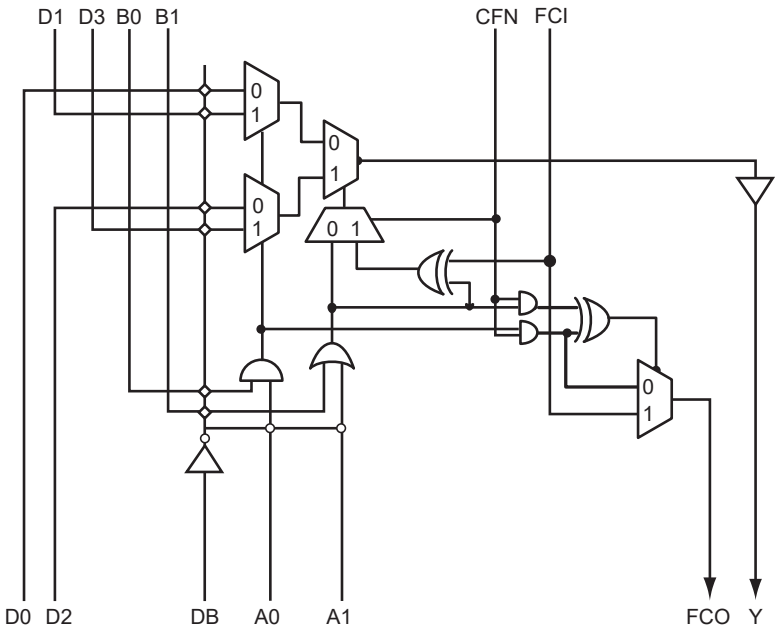
- Eight-input MUX (data: D0-D3, select: A0, A1, B0, B1). User signals can be routed to any one of these inputs. Any of the C-cell inputs (D0-D3, A0, A1, B0, B1) can be tied to one of the four routed clocks (CLKE/F/G/H).
- Inverter (DB input) can be used to drive a complement signal of any of the inputs to the C-cell
- A carry input and a carry output. The carry input signal of the C-cell is the carry output from the C-cell directly to the north.
- Carry connect for carry-chain logic with a signal propagation time of less than 0.1 ns
- A hardwired connection (direct connect) to the adjacent R-cell (Register Cell) for all C-cells on the east side of a SuperCluster with a signal propagation time of less than 0.1 ns

This layout of the C-cell (and the C-cell Cluster) enables the implementation of over 4,000 functions of up to five bits. For example, two C-cells can be used together to implement a four-input XOR function in a single cell delay.

The carry-chain configuration is handled automatically for the user with Microchip's extensive macro library (For a complete listing of available Axcelerator macros, see the Antifuse Macro Library Guide Macro Library Guide).

The following figure shows C-Cell.

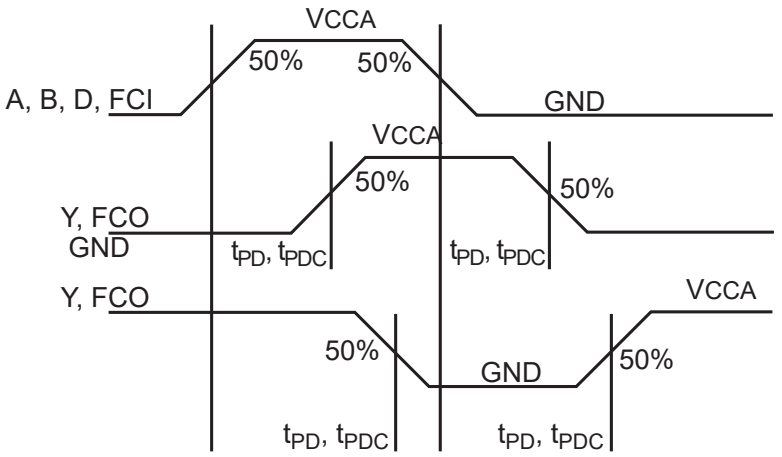
Figure 2-28. C-Cell



2.6.1.1 Timing Model and Waveforms

The following figure shows C-Cell timing model and waveforms.

Figure 2-29. C-Cell Timing Model and Waveforms



2.6.1.2 Timing Characteristics

The following table lists the timing characteristics of C-Cell.

Table 2-66. C-Cell Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
C-Cell Propagation Delays								
t_{PD}	Any input to output Y	—	0.74	—	0.84	—	0.99	ns
t_{PDC}	Any input to carry chain output (FCO)	—	0.57	—	0.64	—	0.76	ns
t_{PDB}	Any input through DB when one input is used	—	0.95	—	1.09	—	1.28	ns

		Min.	Max.	Min.	Max.	Min.	Max.	
C-Cell Propagation Delays								
t_{CC}	Input to carry chain (FCI) to carry chain output (FCO)	—	0.08	—	0.09	—	0.11	ns

2.6.2 Carry-Chain Logic

The Axcelerator dedicated carry-chain logic offers a very compact solution for implementing arithmetic functions without sacrificing performance.

To implement the carry-chain logic, two C-cells in a Cluster are connected together so the FCO (that is, carry out) for the two bits is generated in a carry look-ahead scheme to achieve minimum propagation delay from the FCI (that is, carry in) into the two-bit Cluster. The two-bit carry logic is shown in the following figure.

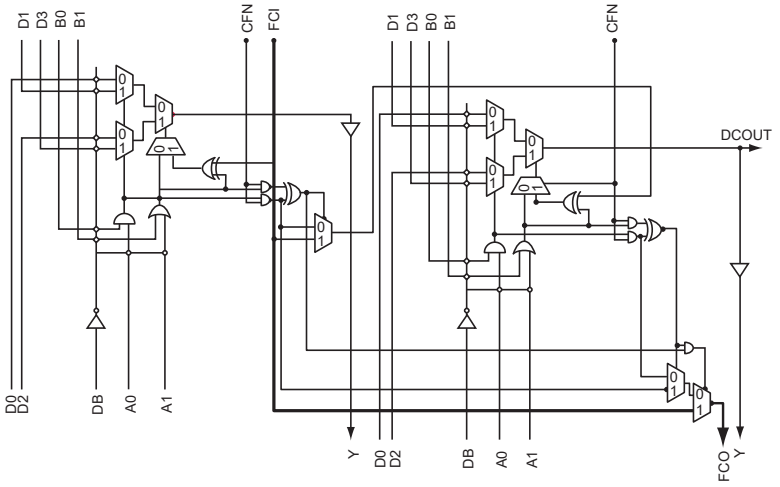
The FCI of one C-cell pair is driven by the FCO of the C-cell pair immediately above it. Similarly, the FCO of one C-cell pair, drives the FCI input of the C-cell pair immediately below it (see Figure 1-4 and Figure 2-31).

The carry-chain logic is selected via the CFN input. When carry logic is not required, this signal is deasserted to save power. Again, this configuration is handled automatically for the user through Microchip's macro library.

The signal propagation delay between two C-cells in the carry-chain sequence is 0.1 ns.

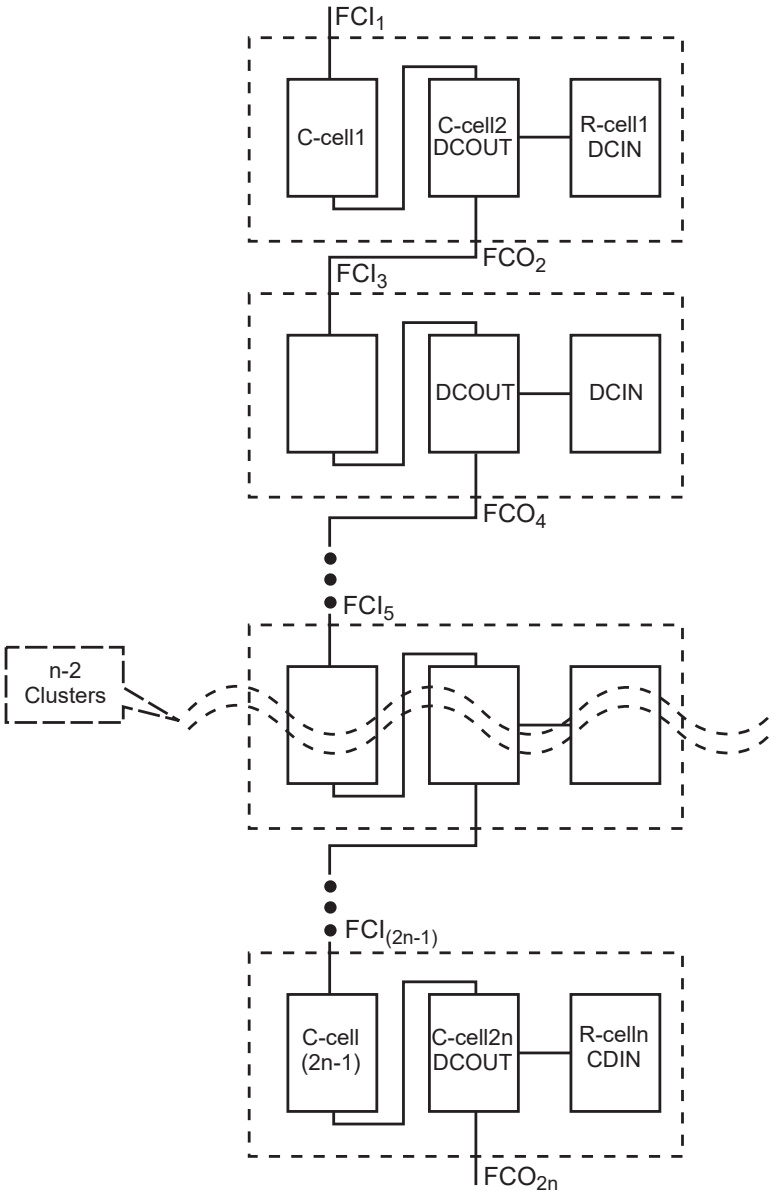
The following figure shows the two-bit carry logic of Axcelerator device.

Figure 2-30. Axcelerator's Two-Bit Carry Logic



The following figure shows carry-chain sequencing of C-Cells.

Figure 2-31. Carry-Chain Sequencing of C-Cells



2.6.2.1 Timing Characteristics

For more information on carry-chain timing characteristics, see Table 2-66.

2.6.3 R-Cell

The R-cell, the sequential logic resource of the Axcelerator devices, is the second logic module type in the AX family architecture. It includes clock inputs for all eight global resources of the Axcelerator architecture as well as global presets and clears (see the following figure).

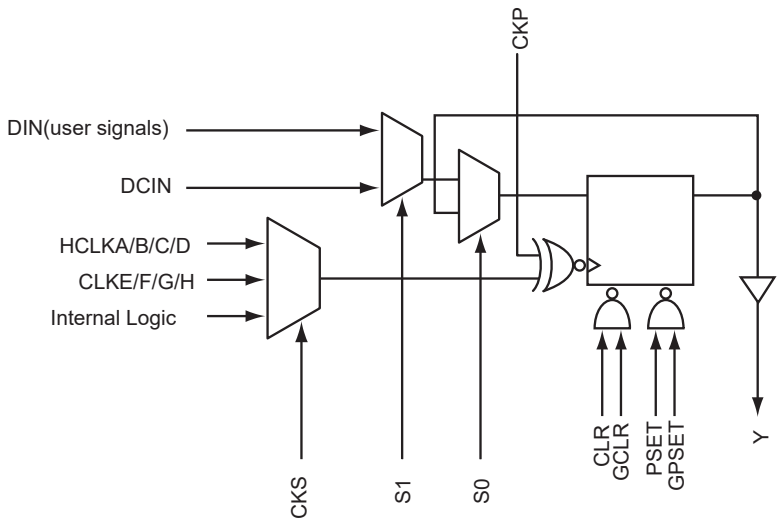
The main features of the R-cell include the following:

- Direct connection to the adjacent logic module through the hardwired connection DCIN. DCIN is driven by the DCOUT of an adjacent C-cell via the Direct-Connect routing resource, providing a connection with less than 0.1 ns of routing delay.

- The R-cell can be used as a standalone flip-flop. It can be driven by any C-cell or I/O modules through the regular routing structure (using DIN as a routable data input). This gives the option of using the R-Cell as a 2:1 MUXed flip-flop as well.
- Provision of data enable-input (S0)
- Independent active-low asynchronous clear (CLR)
- Independent active-low asynchronous preset (PSET). If both CLR and PSET are low, CLR has higher priority
- Clock can be driven by any of the following (CKP selects clock polarity).
  - One of the four high performance hardwired fast clocks (HCLKs)
  - One of the four routed clocks (CLKs)
  - User signals
- Global Power-On Clear (GCLR) and Global Power-On Preset (GPSET), which drive each flip-flop on a chip-wide basis.
  - When the Global Set Fuse option in the Designer software is unchecked (by default), GCLR = 0 and GPSET = 1 at device power-up. When the option is checked, GCLR = 1 and GPSET = 0. Both pins are pulled High when the device is in user mode. For information on simulation support, see the “Simulation Support for GCLR/GPSET in Axcelerator” section in the Antifuse Macro Library Guide.
- S0, S1, PSET, and CLR can be driven by routed clocks CLKE/F/G/H or user signals.
- DIN and S1 can be driven by user signals.

As with the C-cell, the configuration of the R-cell to perform various functions is handled automatically for the user through Microchip's extensive macro library (for a complete listing of available AX macros, see the Antifuse Macro Library Guide).

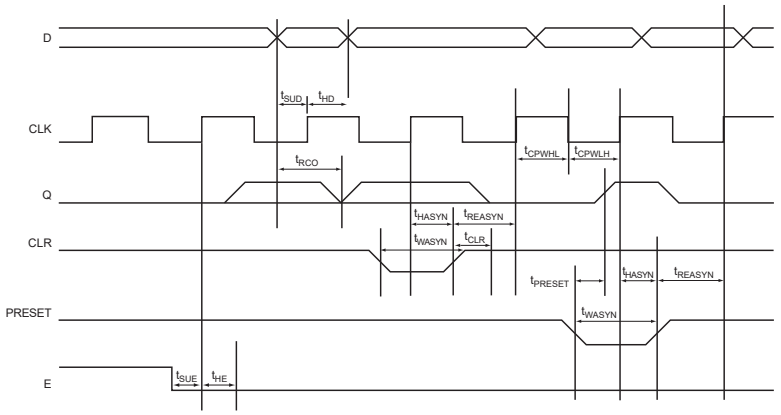
Figure 2-32. R-Cell



2.6.3.1 Timing Models and Waveforms

The following figure shows R-Cell delays.

Figure 2-33. R-Cell Delays



2.6.3.2 Timing Characteristics

The following table lists the timing characteristics of R-Cell.

Table 2-67. R-Cell Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
R-Cell Propagation Delays								
t_{RCO}	Sequential Clock-to-Q	—	0.67	—	0.77	—	0.90	ns

t_{WASYN}	Asynchronous pulse width	0.48	—	0.48	—	0.48	—	ns
t_{REASYN}	Asynchronous recovery time	—	0.23	—	0.27	—	0.31	ns
t_{HASYN}	Asynchronous removal time	—	0.36	—	0.36	—	0.36	ns
t_{CPWHL}	Clock pulse width high to low	0.36	—	0.36	—	0.36	—	ns
t_{CPWLH}	Clock pulse width low to high	0.36	—	0.36	—	0.36	—	ns

2.6.4 Buffer Module

An additional resource inside each SuperCluster is the Buffer (B) module (see Figure 1-4). When a fanout constraint is applied to a design, the synthesis tool inserts buffers as needed. The buffer module has been added to the AX architecture to avoid logic duplication resulting from the hard fanout constraints. The router utilizes this logic resource to save area and reduce loading and delays on medium to high fanout nets.

2.6.4.1 Timing Models and Waveforms

The following figures show the timing model and waveform of buffer module.

Figure 2-34. Buffer Module Timing Model

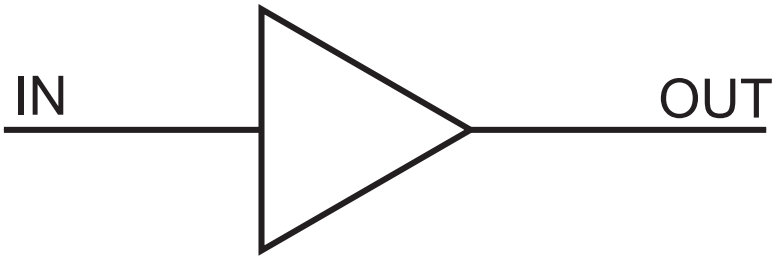

Figure 2-35. Buffer Module Waveform

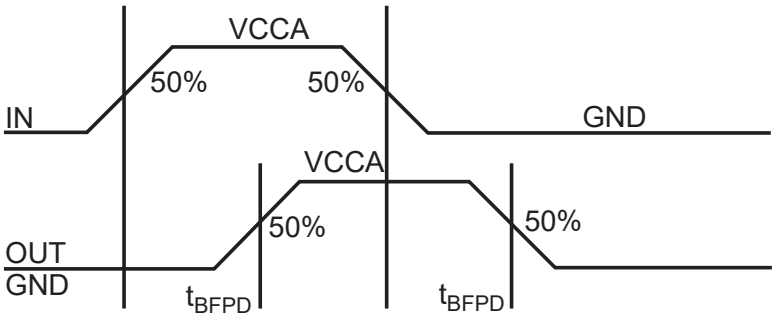


2.6.4.2 Timing Characteristics

The following table lists the timing characteristics of buffer module.

Table 2-68. Buffer Module Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
Buffer Module Propagation Delays								
t_{BFPD}	Any input to output Y	—	0.12	—	0.14	—	0.16	ns

2.7 Routing Specifications

2.7.1 Routing Resources

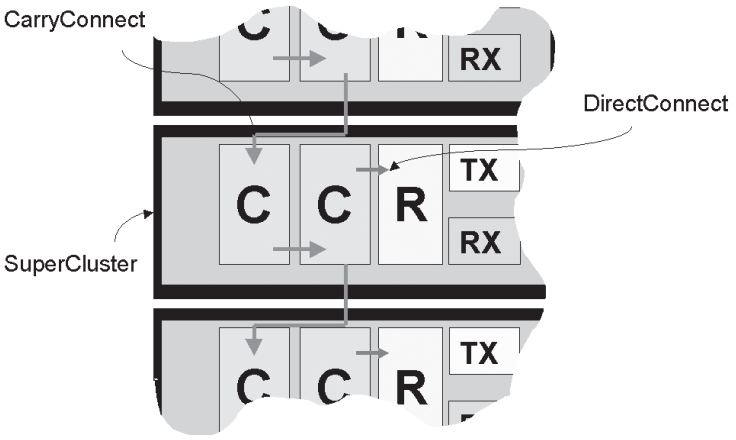
The routing structure found in Axcelerator devices enables any logic module to be connected to any other logic module while retaining high performance. There are multiple paths and routing resources that can be used to route one logic module to another, both within a SuperCluster and elsewhere on the chip.

There are four primary types of routing within the AX architecture: DirectConnect, CarryConnect, FastConnect, and Vertical and Horizontal Routing.

2.7.1.1 DirectConnect

DirectConnects provide a high-speed connection between an R-cell and its adjacent C-cell (see the following figure). This connection can be made from DCOUT of the C-cell to DCIN of the R-cell by configuring of the S1 line of the R-cell. This provides a connection that does not require an antifuse and has a delay of less than 0.1 ns.

Figure 2-36. DirectConnect and CarryConnect



2.7.1.2 CarryConnect

CarryConnects are used to build carry chains for arithmetic functions (see Figure 2-36). The FCO output of the right C-cell of a two C-cell Cluster drives the FCI input of the left C-cell in the two C-cell Cluster immediately below it. This pattern continues down both sides of each SuperCluster column.

Similar to the DirectConnects, CarryConnects can be built without an antifuse connection. This connection has a delay of less than 0.1 ns from the FCO of one two C-cell cluster to the FCI of the two C-cell cluster immediately below it (see Carry-Chain Logic for more information).

2.7.1.3 FastConnect

For high-speed routing of logic signals, FastConnects can be used to build a short distance connection using a single antifuse (see Figure 2-38). FastConnects provide a maximum delay of 0.3 ns. The outputs of each logic module connect directly to the Output Tracks within a SuperCluster. Signals on the Output Tracks can then be routed through a single antifuse connection to drive the inputs of logic modules either within one SuperCluster or in the SuperCluster immediately below it.

2.7.1.4 Vertical and Horizontal Routing

Vertical and Horizontal Tracks provide both local and long distance routing (see the following figure). These tracks are composed of both short-distance, segmented routing, and across-chip routing tracks (segmented at core tile boundaries). The short-distance, segmented routing resources can be concatenated through antifuse connections to build longer routing tracks.

These short-distance routing tracks can be used within and between SuperClusters or between modules of non-adjacent SuperClusters. They can be connected to the Output Tracks and to any logic module input (R-cell, C-cell, Buffer, and TX module).

The across-chip horizontal and vertical routing provides long-distance routing resources. These resources interface with the rest of the routing structures through the RX and TX modules (see the following figure). The RX module is used to drive signals from the across-chip horizontal and vertical routing to the Output Tracks within the SuperCluster. The TX module is used to drive vertical and horizontal across-chip routing from either short-distance horizontal tracks or from Output Tracks. The TX module can also be used to drive signals from vertical across-chip tracks to horizontal across-chip tracks and vice versa.

Figure 2-37. Horizontal and Vertical Tracks

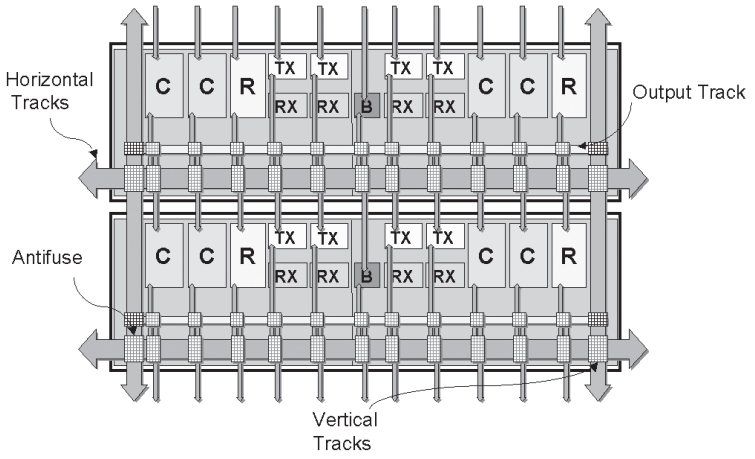


Figure 2-38. FastConnect Routing

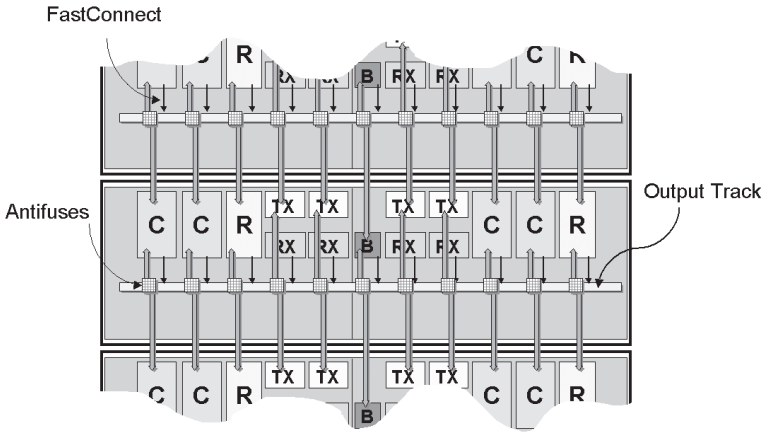

2.7.1.5 Timing Characteristics

The following table lists the predicted routing delays of Axcelerator devices.

Table 2-69. AX125 Predicted Routing Delays Worst-Case Commercial Conditions VCCA = 1.425V, T_J = 70 °C

2.8 Global Resources

One of the most important aspects of any FPGA architecture is its global resources or clocks. The Axcelerator family provides the user with flexible and easy-to-use global resources, without the limitations normally found in other FPGA architectures.

The AX architecture contains two types of global resources, the Hardwired Clock (HCLK) and Routed Clock (CLK). Every Axcelerator device is provided with four HCLKs and four CLKs for a total of eight clocks, regardless of device density.

2.8.1 Hardwired Clocks

The Hardwired Clock (HCLK) is a low-skew network that can directly drive the clock inputs of all sequential modules (R-cells, I/O registers, and embedded RAM/FIFOs) in the device with no antifuse in the path. All four HCLKs are available everywhere on the chip.

Timing Characteristics

The following tables lists the dedicated (hardwired) array clock networks of Axcelerator devices.

Table 2-74. AX125 Dedicated (Hardwired) Array Clock Networks Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

2.8.2 Routed Clocks

The Routed Clock (CLK) is a low-skew network that can drive the clock inputs of all sequential modules in the device (logically equivalent to the HCLK), but has the added flexibility in that it can drive the S0 (Enable), S1, PSET, and CLR input of a register (R-cells and I/O registers) as well as any of the inputs of any C-cell in the device. This allows CLKs to be used not only as clocks, but also for other global signals or high fanout nets. All four CLKs are available everywhere on the chip.

2.8.2.1 Timing Characteristics

The following tables lists the routed array clock networks of Axcelerator devices.

Table 2-79. AX125 Routed Array Clock Networks Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

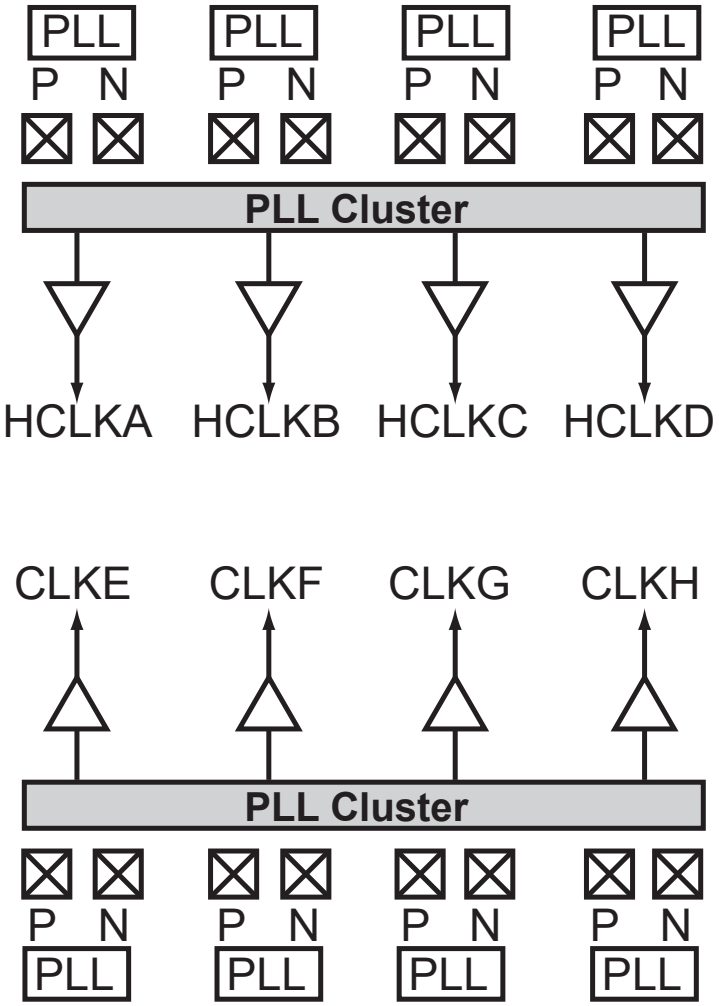
2.8.3 Global Resource Distribution

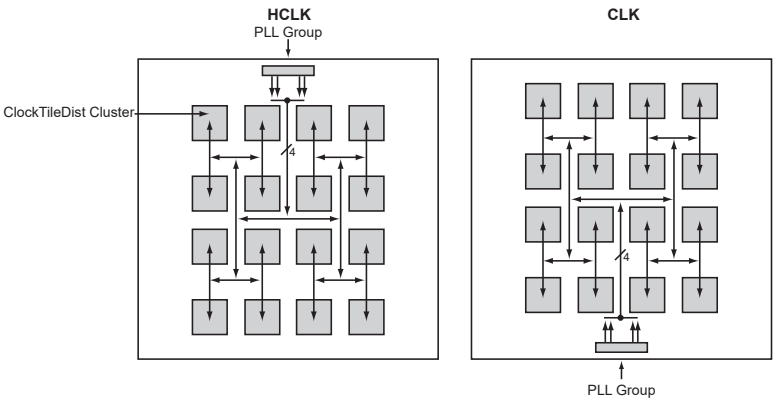
At the root of each global resource is a PLL. There are two groups of four PLLs for every device. One group, located at the center of the north edge (in the I/O ring) of the chip, sources the four HCLKs. The second group, located at the center of the south edge (again in the I/O ring), sources the four CLKs (see the following figure).

Figure 2-39. PLL Group



Regardless of the type of global resource, HCLK or CLK, each of the eight resources reach the ClockTileDist (CTD) Cluster located at the center of every core tile with zero skew. From the ClockTileDist Cluster, all four HCLKs and four CLKs are distributed through the core tile (see the following figure).

Figure 2-40. Example of HCLK and CLK Distributions on the AX2000



The ClockTileDist Cluster contains an HCLKMux (HM) module for each of the four HCLK trees and a CLKMux (CM) module for each of the CLK trees. The HCLK branches then propagate horizontally through the middle of the core tile to HCLKColDist (HD) modules in every SuperCluster column. The CLK branches propagate vertically through the center of the core tile to CLKRowDist (RD) modules in every SuperCluster row. Together, the HCLK and CLK branches provide for a low-skew global fanout within the core tile (see the following figures).

Figure 2-41. CTD, CD, and HD Module Layout

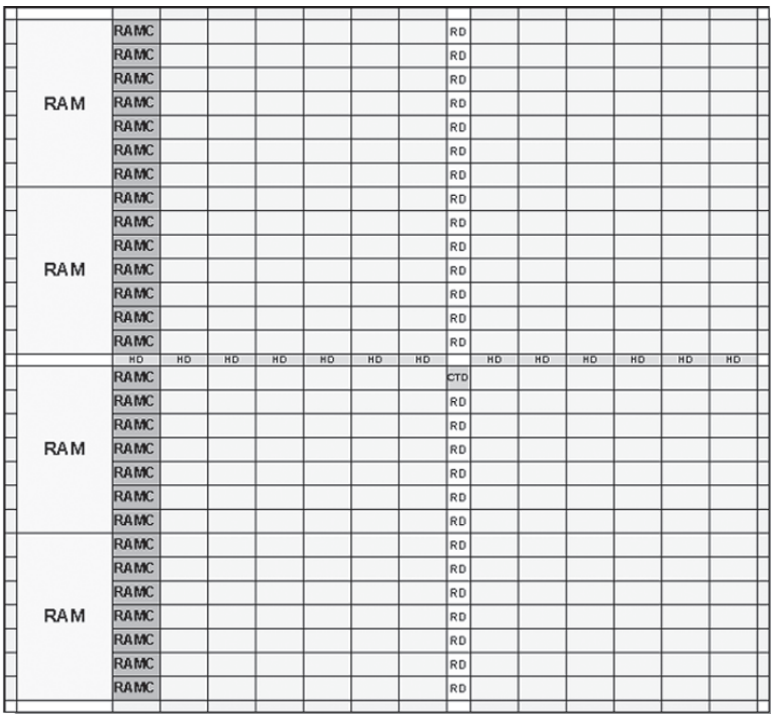


Figure 2-42. HCLK and CLK Distribution within a Core Tile

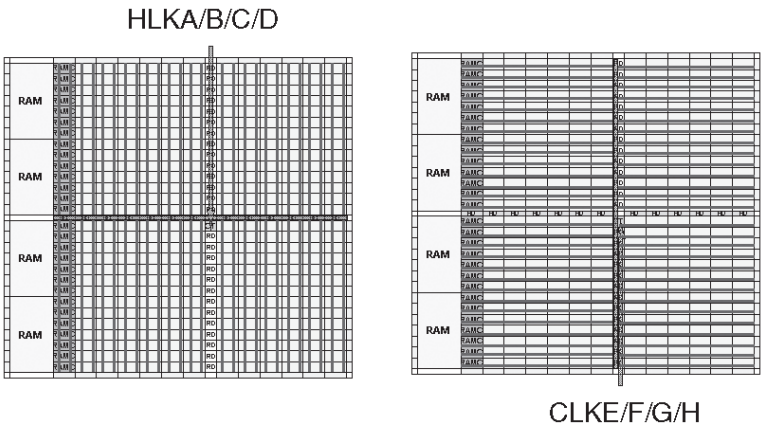


The HM and CM modules can select between:

- The HCLK or CLK source respectively
- A local signal routed on generic routing resources

This allows each core tile to have eight clocks independent of the other core tiles in the device.

Both HCLK and CLK are segmentable, meaning that individual branches of the global resource can be used independently.

Like the HM and CM modules, the HD and RD modules can select between:

- The HCLK or CLK source from the HM or CM module respectively
- A local signal routed on generic routing resources

The AX architecture is capable of supporting a large number of local clocks—24 segments per HCLK driving north-south and 28 segments per CLK driving east-west per core tile.

Microchip's Designer software's place-and-route takes advantage of the segmented clock structure found in Axcelerator devices by turning off any unused clock segments. This results in not only better performance but also lower power consumption.

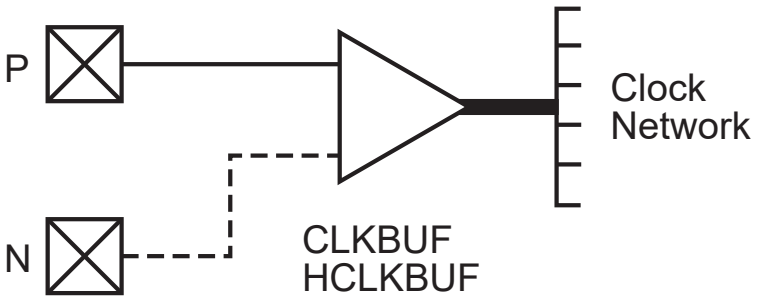
2.8.4 Global Resource Access Macros

Global resources can be driven by one of three sources: external pad(s), an internal net, or the output of a PLL. These connections can be made by using one of three types of macros: CLKBUF, CLKINT, and PLLCLK.

2.8.4.1 CLKBUF and HCLKBUF

CLKBUF (HCLKBUF) is used to drive a CLK (HCLK) from external pads. These macros can be used either generically or with the specific I/O standard desired (for example, CLKBUF_LVCMOS25, HCLKBUF_LVDS, and so on). See the following figure.

Figure 2-43. CLKBUF and HCLKBUF



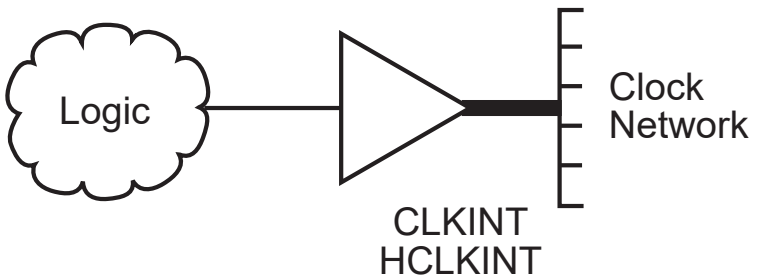
Package pins CLKEP and CLKEN are associated with CLKE, package pins HCLKAP and HCLKAN are associated with HCLKA, and so on.

Note that when CLKBUF (HCLKBUF) is used with a single-ended I/O standard, it must be tied to the P-pad of the CLK (HCLK) package pin. In this case, the CLK (HCLK) N-pad can be used for user signals.

2.8.4.2 CLKINT and HCLKINT

CLKINT (HCLKINT) is used to access the CLK (HCLK) resource internally from the user signals (see the following figure).

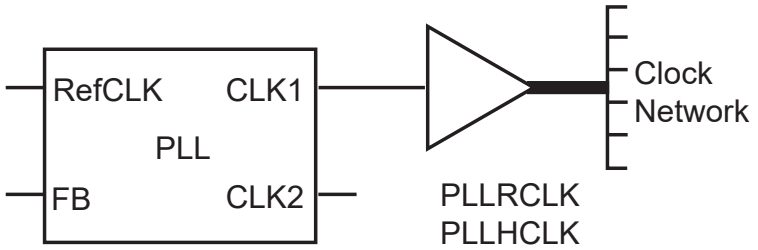
Figure 2-44. CLKINT and HCLKINT



2.8.4.3 PLLRCLK and PLLHCLK

PLLRCLK (PLLHCLK) is used to drive global resource CLK (HCLK) from a PLL (see the following figure).

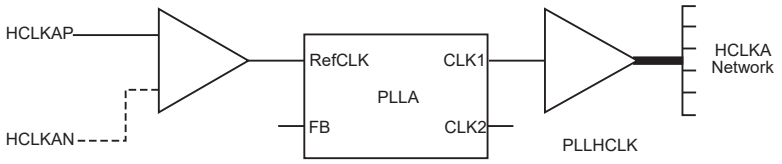
Figure 2-45. PLLRCLK and PLLHCLK



2.8.5 Using Global Resources with PLLs

Each global resource has an associated PLL at its root. For example, PLLA can drive HCLKA, PLLE can drive CLKE, and so on. (see the following figure).

Figure 2-46. Example of HCLKA Driven from a PLL with External Clock Source



In addition, each clock pin of the package can be used to drive either its associated global resource or PLL. For example, package pins CLKEP and CLKEN can drive either the RefCLK input of PLLE or CLKE.

There are two macros required when interfacing the embedded PLLs with the global resources: PLLINT and PLLOUT.

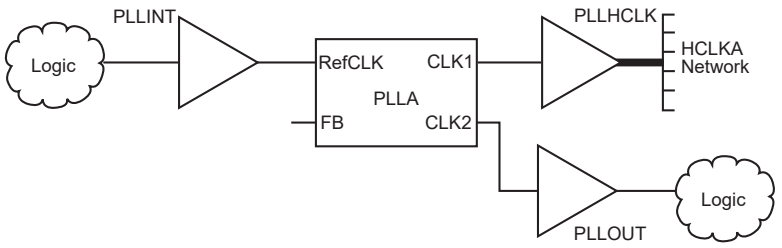
2.8.5.1 PLLINT

This macro is used to drive the RefCLK input of the PLL internally from user signals.

2.8.5.2 PLLOUT

This macro is used to connect either the CLK1 or CLK2 output of a PLL to the regular routing network (see the following figure).

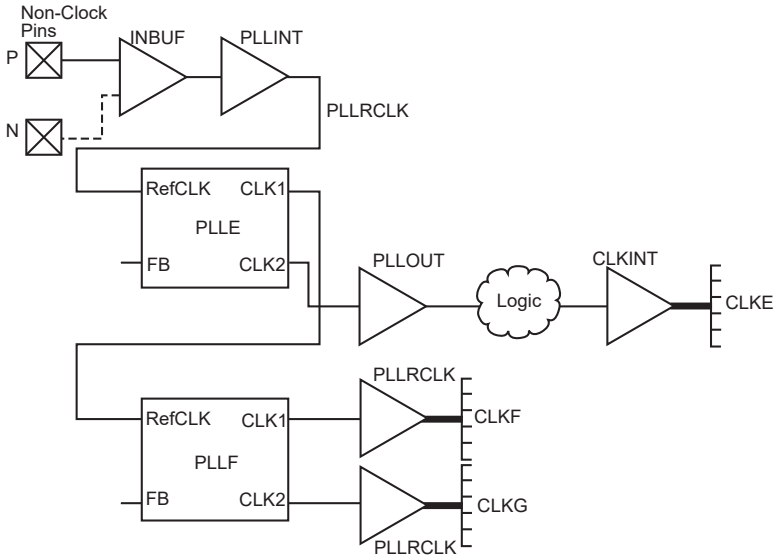
Figure 2-47. Example of PLLINT and PLLOUT Usage



2.8.5.3 Implementation Example

The following figure shows a complex clock distribution example. The reference clock (RefCLK) of PLLE is being sourced from non-clock signal pins (INBUF to PLLINT). The CLK1 output of PLLE is being fed to the RefCLK input of PLLF. The CLK2 output of PLLE is driving logic (via PLLOUT). In turn, this logic is driving the global resource CLKE. PLLF is driving both CLKF and CLKG global resources.

Figure 2-48. Complex Clock Distribution Example



2.9 Axcelerator Clock Management System

Each member of the Axcelerator family[6] contains eight Phase-Locked Loop (PLL) blocks, which perform the following functions:

- Programmable Delay (32 steps of 250 ps)
- Clock Skew Minimization
- Clock Frequency Synthesis

Each PLL has the following key features:

- Input Frequency Range: 14 to 200 MHz
- Output Frequency Range: 20 MHz to 1 GHz
- Output Duty Cycle Range: 45% to 55%
- Maximum Long-Term Jitter: 1% or 100ps (whichever is greater)
- Maximum Short-Term Jitter: 50ps + 1% of Output Frequency
- Maximum Acquisition Time (lock): 20µs

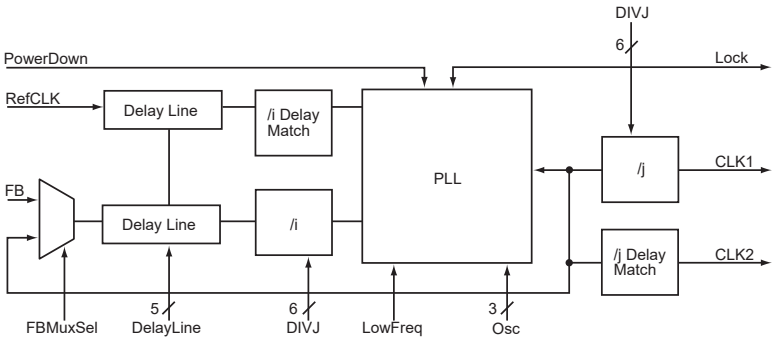
2.9.1 Physical Implementation

The eight PLL blocks are arranged in two groups of four. One group is located in the center of the northern edge of the chip, while the second group is centered on the southern edge. The northern group is associated with the four HCLK networks (for example, PLLA can drive HCLKA), while the southern group is associated with the four CLK networks (for example, PLLE can drive CLKE).

Each PLL cell is connected to two I/O pads and a PLL Cluster that interfaces with the FPGA core. The following figure illustrates a PLL block. The VCCPLL pin should be connected to a 1.5V power supply through a 250Ω resistor. Furthermore, 0.1 µF and 10 µF decoupling capacitors should be connected across the VCCPLL and VCOMPPLL pins.

[6] AX2000-CQ256 does not support operation of the Phase-Locked Loops. This is in order to support full pin compatibility with RTAX2000S/SL-CQ256.

Figure 2-49. PLL Block Diagram



The VCOMPPLL pin should never be grounded (see Figure 2-2).

The I/O pads associated with the PLL can also be configured for regular I/O functions, except when it is used as a clock buffer. The I/O pads can be configured in all the modes available to the regular I/O pads in the same I/O bank. In particular, the [H]CLKxP pad can be configured as a differential pair, single-ended, or voltage-referenced standard. The [H]CLKxN pad can only be used as a differential pair with [H]CLKxP.

The block marked "/i Delay Match" is a fixed delay equal to that of the i divider. The "/j Delay Match" block has the same function as its j divider counterpart.

2.9.2 Functional Description

Figure 2-49 illustrates a block diagram of the PLL. The PLL contains two dividers, i and j, that allow frequency scaling of the clock signal:

- The i divider in the feedback path allows multiplication of the input clock by integer factors ranging from 1 to 64, and the resultant frequency is available at the output of the PLL block.
- The j divider divides the PLL output by integer factors ranging from 1 to 64, and the divided clock is available at CLK1.
- The two dividers together can implement any combination of multiplication and division up to a maximum frequency of 1 GHz on CLK1. Both the CLK1 and CLK2 outputs have a fixed 50/50 duty cycle.
- The output frequencies of the two clocks are given by the following formulas (fREF is the reference clock frequency):
  fCLK1 = fREF × (DividerI) / (DividerJ)

  fCLK2 = fREF × (DividerI)
- CLK2 provides the PLL output directly—without division

The input and output frequency ranges are selected by LowFreq and Osc(2:0), respectively. These functions and their possible values are detailed in the following table.

The delay lines shown in Figure 2-49 are programmable. The feedback clock path can be delayed (using the five DelayLine bits) relative to the reference clock (or vice versa) by up to 3.75 ns in increments of 250 ps. The following table describes the usage of these bits. The delay increments are independent of frequency, so this results in phase changes that vary with frequency. The delay value is highly dependent on VCC and the speed grade.

The following figure is a logical diagram of the various control signals to the PLL and shows how the PLL interfaces with the global and routing networks of the FPGA. Note that not all signals are user-accessible. These non-user-accessible signals are used by the place-and-route tool to control the configuration of the PLL. The user gains access to these control signals either based upon the connections built in the user's design or through the special macros (see Table 2-88) inserted into the design. For example, connecting the macro PLLOUT to CLK2 will control the OUTSEL signal.

Figure 2-50. PLL Logical Interface

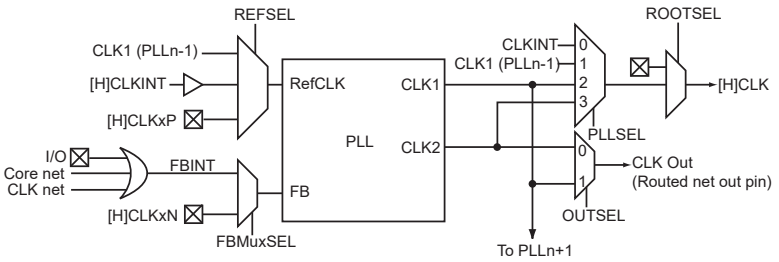


Table 2-84. PLL Interface Signals

Signal Name	Type	User Accessible	Allowable Values	Function
RefCLK	Input	Yes	—	Reference Clock for the PLL
FB	Input	Yes	—	Feedback port for the PLL
PowerDown	Input	Yes	—	PLL power down control
			0	PLL powered down
			1	PLL active
DIVI[5:0]	Input	Yes	1 to 64, in unsigned binary notation offset by -1	Sets value for feedback divider (multiplier)
DIVJ[5:0]	Input	Yes		Sets value for CLK1 divider
LowFreq	Input	Yes	—	Input frequency range selector
			0	50–200 MHz
			1	14–50 MHz
Osc[2:0]	Input	Yes	—	Output frequency range selector
			XX0	400–1000 MHZ
			001	200–400 MHZ
			011	100–200 MHZ
			101	50–100 MHZ
			111	20–50 MHZ
DelayLine[4:0]	Input	Yes	–15 to +15 (increments), in signed-and-magnitude binary representation	Clock Delay (positive/negative) in increments of 250 ps, with maximum value of ± 3.75 ns
FBMuxSel	Input	No	—	Selects the source for the feedback input
REFSEL	Input	No	—	Selects the source for the reference clock
OUTSEL	Input	No	—	Selects the source for the routed net output
PLLSEL	Input	No	—	ROOTSEL and PLLSEL are used to select the source of the global clock network
ROOTSEL	Input	No	—	—
Lock	Output	Yes	—	High value indicates PLL has locked
CLK1	Output	Yes	—	PLL clock output
CLK2	Output	Yes	—	PLL clock output

Note: If the input RefClk is taken outside its operating range, the outputs Lock and CLK1 and CLK2 are indeterminate.

2.9.3 PLL Configurations

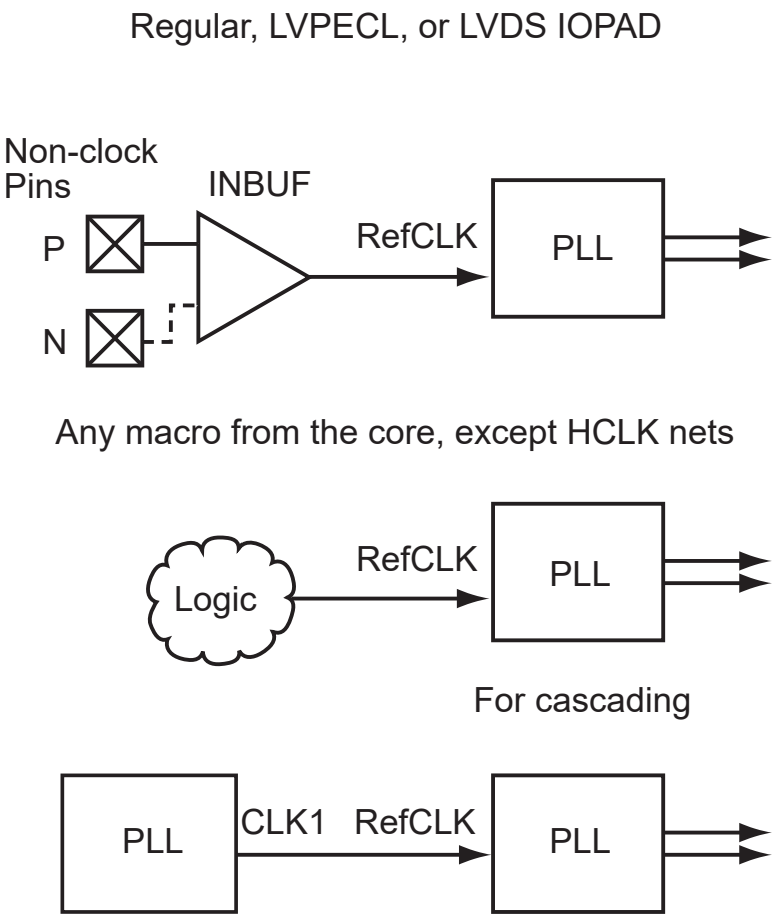
The following configurations apply to the different PLL inputs and outputs.

2.9.3.1 Reference Clock

The RefCLK can be driven by the following:

- Global routed clocks (CLKE/F/G/H) or user-created clock network
- CLK1 output of an adjacent PLL
- [H]CLKxP (single-ended or voltage-referenced)
- [H]CLKxP/[H]CLKxN pair (differential modes like LVPECL or LVDS)

Figure 2-51. Reference Clock Connections

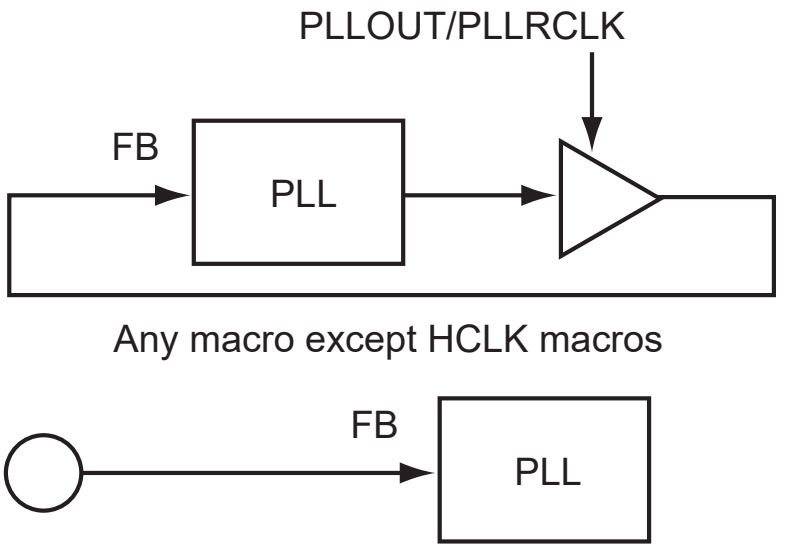


2.9.3.2 Feedback Clock

The feedback clock can be driven by the following:

- Global routed clocks (CLKE/F/G/H) or user-created clock network
- External [H]CLKxP/N I/O pad(s) from the adjacent PLL cell
- An internal signal from the PLL block

Figure 2-52. Feedback Clock Connections



2.9.3.3 CLK1 and CLK2

Both PLL outputs, CLK1 and CLK2, can be used to drive a global resource, an adjacent PLL RefCLK input, or a net in the FPGA core. Not all drive combinations are possible (see the following table).

Table 2-85. PLL General Connections Rules

CLK1	CLK2
HCLK	HCLK
CLK	CLK
HCLK	Routed net output
Routed net output	HCLK
HCLK	NONE
NONE	HCLK
CLK	NONE
NONE	CLK

Note: The PLL outputs remain Low when REFCLK is constant (either Low or High).

2.9.3.4 Restrictions on CLK1 and CLK2

- When both are driving global resources, they must be driving the same type of global resource (that is, either HCLK or CLK)
- Only one can drive a routed net at any given time

The following tables specify all the possible CLK1 and CLK2 connections for the north and south PLLs. HCLK1 and HCLK2 are used to denote the different HCLK networks when two are being driven at the same time by a single PLL (the HCLK1 is the primary clock resource associated with the PLL, and HCLK2 is the clock resource associated with the adjacent PLL). Likewise, CLK1 and CLK2 are used to denote the different CLK networks when two are being driven at the same time by a single PLL (see Figure 2-49).

Table 2-86. North PLL Connections

CLK1	CLK2
HCLK1	Routed net
HCLK1	Unused
HCLK2	HCLK1

.....continued	
CLK1	**CLK2**
HCLK2	Routed net
HCLK2	Both HCLK1 and routed net
HCLK2	Unused
Unused	HCLK1
Unused	Routed net
Unused	Both HCLK1 and routed net
Unused	Unused
Routed net	HCLK1
Routed net	Unused
Both HCLK1 and HCLK2	Routed net
Both HCLK1 and HCLK2	Unused
Both HCLK1 and routed net	Unusable
Both HCLK2 and routed net	HCLK1
Both HCLK2 and routed net	Unused
HCLK1, HCLK2, and routed net	Unusable

Note: Designer software currently does not support all of these connections. Only exclusive connections where one output connects to a single net are supported at this time (for example, CLK1 driving HCLK1, and HCLK2 is not supported).

Table 2-87. South PLL Connections

CLK1	CLK2
CLK1	Routed net
CLK1	Unused
CLK2	CLK1
CLK2	Routed net
CLK2	Both CLK1 and routed net
CLK2	Unused
Unused	CLK1
Unused	Routed net
Unused	Both CLK1 and routed net
Unused	Unused
Routed net	CLK1
Routed net	Unused
Both CLK1 and CLK2	Routed net
Both CLK1 and CLK2	Unused
Both CLK1 and routed net	Unusable
Both CLK2 and routed net	CLK1
Both CLK2 and routed net	Unused
CLK1, CLK2, and routed net	Unusable

Note: Designer software currently does not support all of these connections. Only exclusive connections where one output connects to a single net are supported at this time (for example, CLK1 driving both CLK1 and CLK2 is not supported).

2.9.4 Special PLL Macros

The following tables show the macros used to connect the RefCLK input and CLK1 and CLK2 outputs using the different routing resources.

Table 2-88. PLL Special Macros

Macro Name	Usage
PLLINT	Connects RefCLK to a regular routed net or a pad.
PLLRCLK	Connects CLK1 or CLK2 to the CLK network.
PLLHCLK	Connects CLK1 or CLK2 to the HCLK network.
PLLOUT	Connects CLK1 or CLK2 to a regular routed net.

Table 2-89. Electrical Specifications

Parameter	Value	Notes
Frequency Ranges		
Reference frequency (min.)	14 MHz	Lowest input frequency
Reference frequency (max.)	200 MHz	Highest input frequency
OSC frequency (min.)	20 MHz	Lowest output frequency
OSC frequency (max.)	1 GHz	Highest output frequency
Jitter		
Long-term jitter (max.)	1%	Percentage of period, low reference clock frequencies
Long-term jitter (max.)	100ps	High reference clock frequencies
Short-term jitter (max.)	50ps+1%	Percentage of output frequency
Acquisition Time (lock) from Cold Start		
Acquisition time (max.)[1]	400 cycles	Period of low reference clock frequencies
Acquisition time (max.)[1]	1.5 µs	High reference clock frequencies
Power Consumption		
Analog supply current (low freq.)	200 µA	Current at minimum oscillator frequency
Analog supply current (high freq.)	200 µA	Frequency-dependent current
Digital Supply Current (low freq.)	0.5 µA/MHz	Current at maximum oscillator frequency, unloaded
Digital supply current (high freq.)	1 µA/MHz	Frequency-dependent current
Duty Cycle		
Minimum output duty cycle	45%	—
Maximum output duty cycle	55%	—

Note:

1. The lock bit remains Low until RefCLK reaches the minimum input frequency.

2.9.5 User Flow

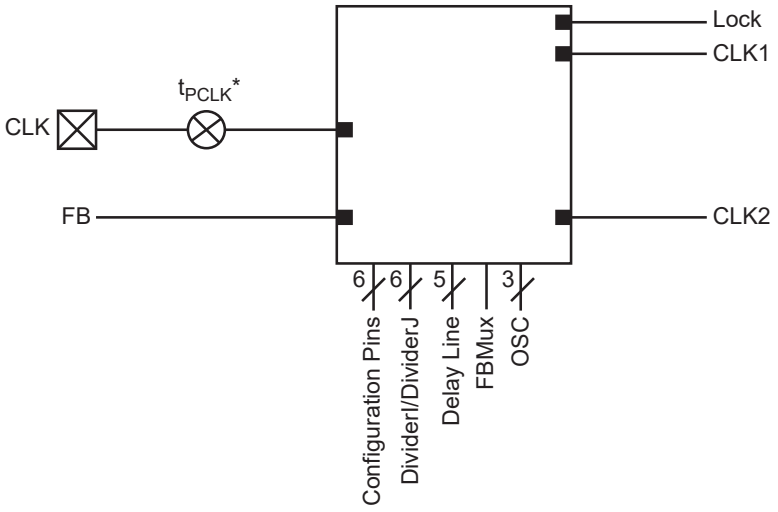
There are two methods of including a PLL in a design:

- The recommended method of using a PLL is to create custom PLL blocks using Microchip's macro generator, SmartGen, that can be instantiated in a design.
- The alternative method is to instantiate one of the generic library primitives (PLL or PLLFB) into either a schematic or HDL netlist, using inverters for polarity control and tying all unused address and data bits to ground.

2.9.5.1 Timing Model

The following figure shows the timing model of PLL.

Figure 2-53. PLL Model

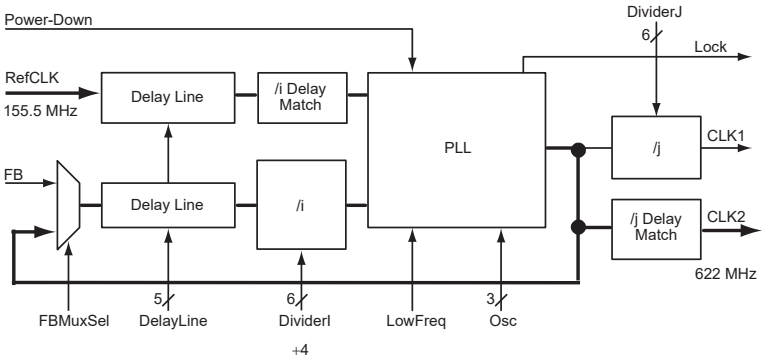


2.9.6 Sample Implementations

2.9.6.1 Frequency Synthesis

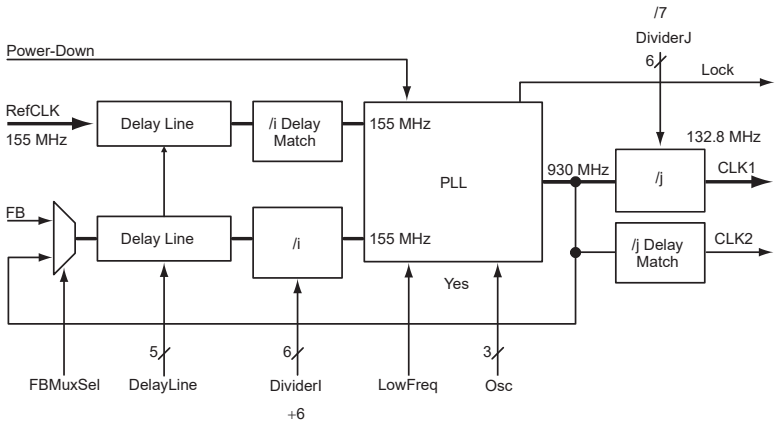
The following figure illustrates an example where the PLL is used to multiply a 155.5 MHz external clock up to 622 MHz. Note that the same PLL schematic could use an external 350 MHz clock, which is divided down to 155 MHz by the FPGA internal logic.

Figure 2-54. Using the PLL 155.5 MHz In and 622 MHz Out



The following figure illustrates the PLL using both dividers to synthesize a 133 MHz output clock from a 155 MHz input reference clock. The input frequency of 155 MHz is multiplied by 6 and divided by 7, giving a CLK1 output frequency of 132.86 MHz. When dividers are used, a given ratio can be generated in multiple ways, allowing the user to stay within the operating frequency ranges of the PLL.

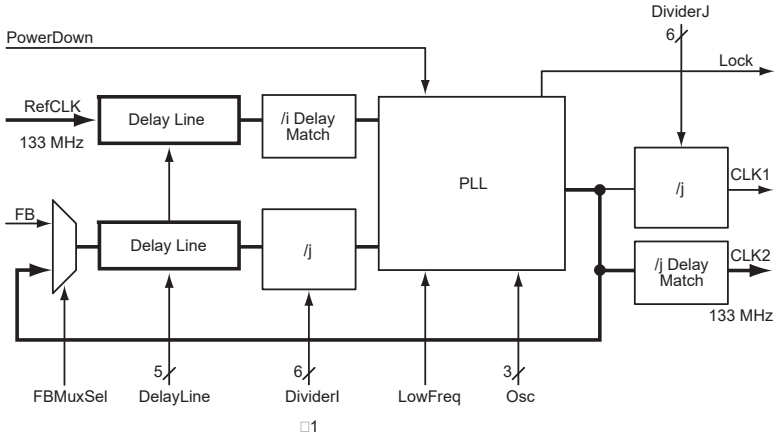
Figure 2-55. Using the PLL 155 MHz In and 133 MHz Out



2.9.6.2 Adjustable Clock Delay

The following figure illustrates using the PLL to delay the reference clock by employing one of the adjustable delay lines. In this case, the output clock is delayed relative to the reference clock. Delaying the reference clock relative to the output clock is accomplished by using the delay line in the feedback path.

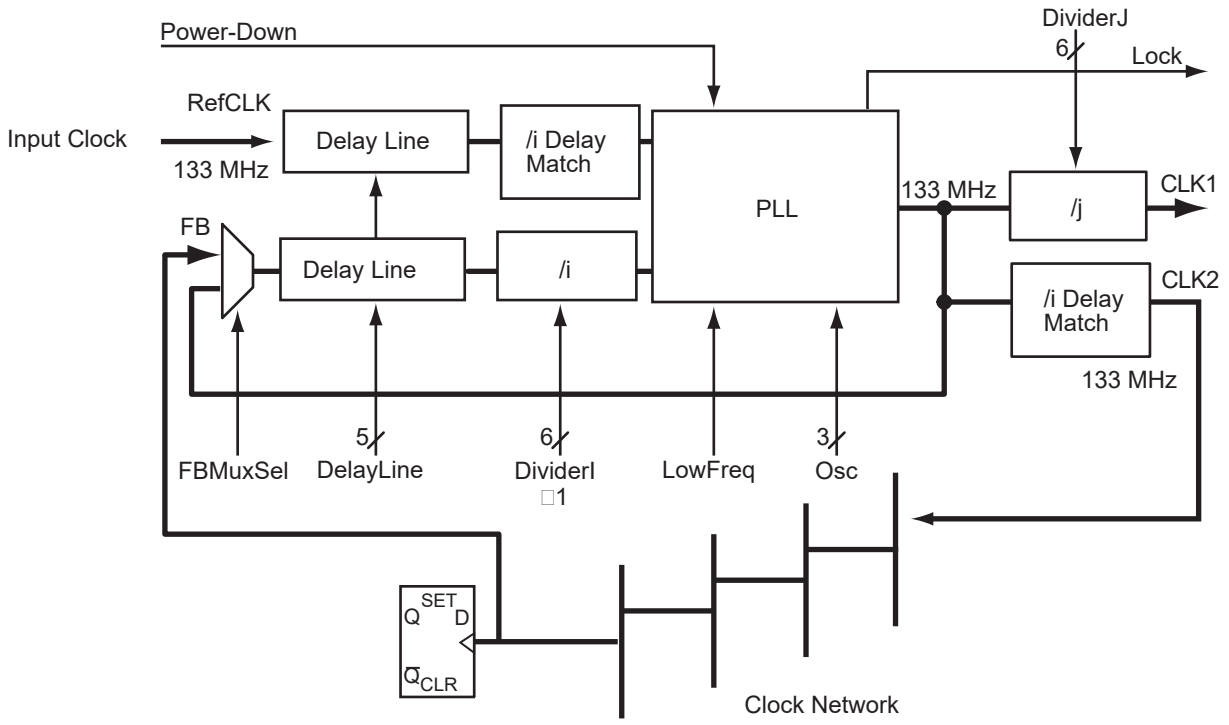
Figure 2-56. Using the PLL Delaying the Reference Clock



2.9.7 Clock Skew Minimization

The following figure indicates how feedback from the clock network can be used to create minimal skew between the distributed clock network and the input clock. The input clock is fed to the reference clock input of the PLL. The output clock (CLK2) feeds a routed clock network. The feedback input to the PLL uses a clock input delayed by a routing network. The PLL then adjusts the phase of the input clock to match the delayed clock, thus providing nearly zero effective skew between the two clocks. For more information, see the Axcelerator Family PLL and Clock Management application note.

Figure 2-57. Using the PLL for Clock Deskewing



2.10 Embedded Memory

The AX architecture provides extensive, high-speed memory resources to the user. Each 4,608 bit block of RAM contains its own embedded FIFO controller, allowing the user to configure each block as either RAM or FIFO.

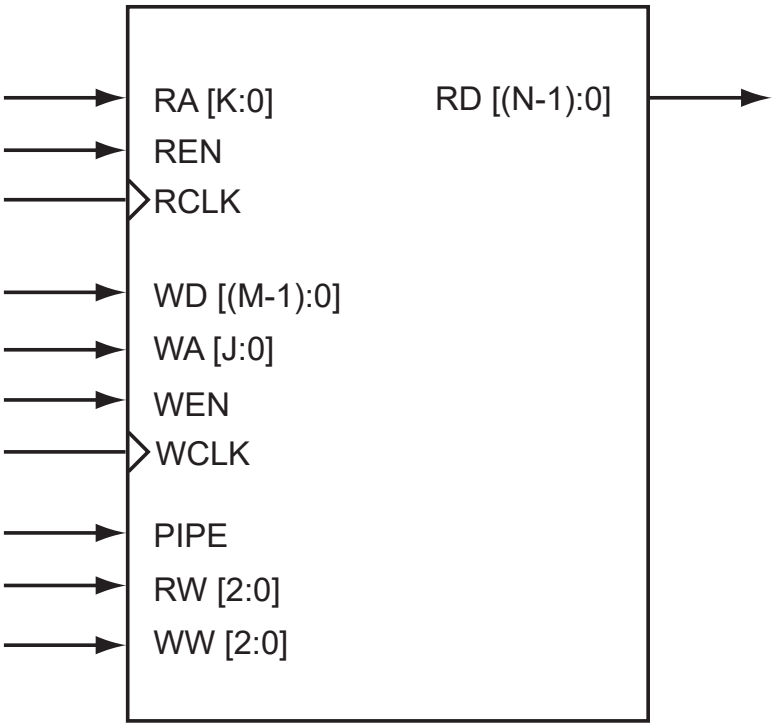
To meet the needs of high performance designs, the memory blocks operate in synchronous mode for both read and write operations. However, the read and write clocks are completely independent, and each may operate up to and above 500 MHz.

No additional core logic resources are required to cascade the address and data buses when cascading different RAM blocks. Dedicated routing runs along each column of RAM to facilitate cascading.

The AX memory block includes dedicated FIFO control logic to generate internal addresses and external flag logic (FULL, EMPTY, AFULL, and AEMPTY). Since read and write operations can occur asynchronously to one another, special control circuitry is included to prevent metastability, overflow, and underflow. A block diagram of the memory module is illustrated in the following figure.

During RAM operation, read (RA) and write (WA) addresses are sourced by user logic and the FIFO controller is ignored. In FIFO mode, the internal addresses are generated by the FIFO controller and routed to the RAM array by internal MUXes. Enables with programmable polarity are provided to create upper address bits for cascading up to 16 memory blocks. When cascading memory blocks, the bussed signals WA, WD, WEN, RA, RD, and REN are internally linked to eliminate external routing congestion.

Figure 2-58. Axcelerator Memory Module



2.10.1 RAM

Each memory block consists of 4,608 bits that can be organized as 128x36, 256x18, 512x9, 1kx4, 2kx2, or 4kx1 and are cascadable to create larger memory sizes. This allows built-in bus width conversion (see the following table). Each block has independent read and write ports which enable simultaneous read and write operations.

Table 2-90. Memory Block WxD Options

Data-word (in bits)	Depth	Address Bus	Data Bus
1	4,096	RA/WA[11:0]	RD/WD[0]
2	2,048	RA/WA[10:0]	RD/WD[1:0]
4	1,024	RA/WA[9:0]	RD/WD[3:0]
9	512	RA/WA[8:0]	RD/WD[8:0]
18	256	RA/WA[7:0]	RD/WD[17:0]
36	128	RA/WA[6:0]	RD/WD[35:0]

2.10.2 Clocks

The RCLK and the WCLK have independent source polarity selection and can be sourced by any global or local signal.

2.10.3 RAM Configurations

The AX architecture allows the read side and write side of RAMs to be organized independently, allowing for bus conversion. For example, the write side can be set to 256x18 and the read side to 512x9.

Both the write width and read width for the RAM blocks can be specified independently and changed dynamically with the WW (write width) and RW (read width) pins. The D x W different configurations are: 128 x 36, 256 x 18, 512 x 9, 1k x 4, 2k x 2, and 4k x 1. The allowable RW and WW values are shown in the following table.

Table 2-91. Allowable RW and WW Values

RW(2:0)	WW(2:0)	D x W
000	000	4k x 1
001	001	2k x 2
010	010	1k x 4
011	011	512 x 9
100	100	256 x 18
101	101	128 x 36
11x	11x	reserved

When widths of one, two, and four are selected, the ninth bit is unused. For example, when writing nine-bit values and reading four-bit values, only the first four bits and the second four bits of each nine-bit value are addressable for read operations. The ninth bit is not accessible. Conversely, when writing four-bit values and reading nine-bit values, the ninth bit of a read operation will be undefined.

Note that the RAM blocks employ little-endian byte order for read and write operations.

The following table lists the RAM signals and their descriptions.

Table 2-92. RAM Signal Description

Signal	Direction	Description
WCLK	Input	Write clock (can be active on either edge)
WA[J:0]	Input	Write address bus.The value J is dependent on the RAM configuration and the number of cascaded memory blocks. The valid range for J is from 6 to15.
WD[M-1:0]	Input	Write data bus. The value M is dependent on the RAM configuration and can be 1, 2, 4, 9, 18, or 36.
RCLK	Input	Read clock (can be active on either edge)
RA[K:0]	Input	Read address bus. The value K is dependent on the RAM configuration and the number of cascaded memory blocks. The valid range for K is from 6 to 15.
RD[N-1:0]	Output	Read data bus. The value N is dependent on the RAM configuration and can be 1, 2, 4, 9, 18, or 36.
REN	Input	Read enable. When this signal is valid on the active edge of the clock, data at location RA will be driven onto RD.
WEN	Input	Write enable. When this signal is valid on the active edge of the clock, WD data will be written at location WA.
RW[2:0]	Input	Width of the read operation dataword
WW[2:0]	Input	Width of the write operation dataword
Pipe	Input	Sets the pipe option to be on or off

2.10.4 Modes of Operation

There are two read modes and one write mode:

- Read Nonpipelined (synchronous—one clock edge)
- Read Pipelined (synchronous—two clock edges)
- Write (synchronous—one clock edge)

In the standard read mode, new data is driven onto the RD bus in the clock cycle immediately following RA and REN valid. The read address is registered on the read-port active-clock edge and data appears at read-data after the RAM access time. Setting the PIPE to OFF enables this mode.

The pipelined mode incurs an additional clock delay from address to data, but enables operation at a much higher frequency. The read-address is registered on the read-port active-clock edge, and the

read data is registered and appears at RD after the second read clock edge. Setting the PIPE to On enables this mode.

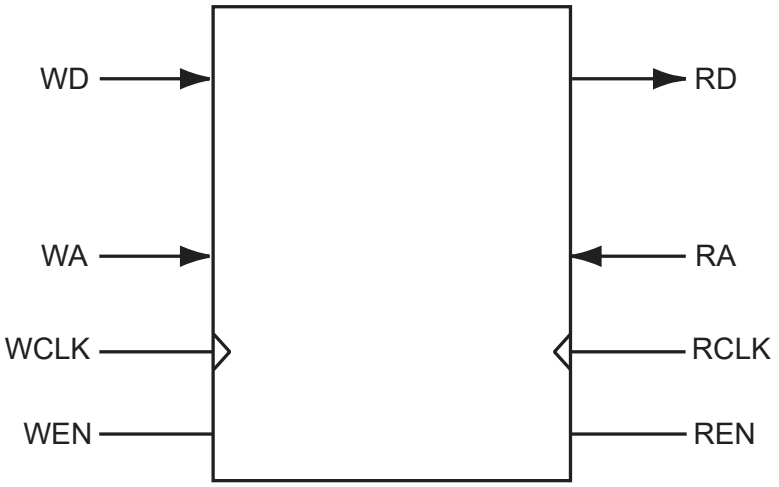
On the write active-clock edge, the write data are written into the SRAM at the write address when Wen is high. The setup time of the write address, write enables, and write data are minimal with respect to the write clock.

Write and read transfers are described with timing requirements beginning in the Timing Characteristics.

2.10.4.1 Timing Characteristics

The following figure shows the timing model of SRAM.

Figure 2-59. SRAM Model



The following figures shows the timing waveforms of RAM write and RAM read.

Figure 2-60. RAM Write Timing Waveforms

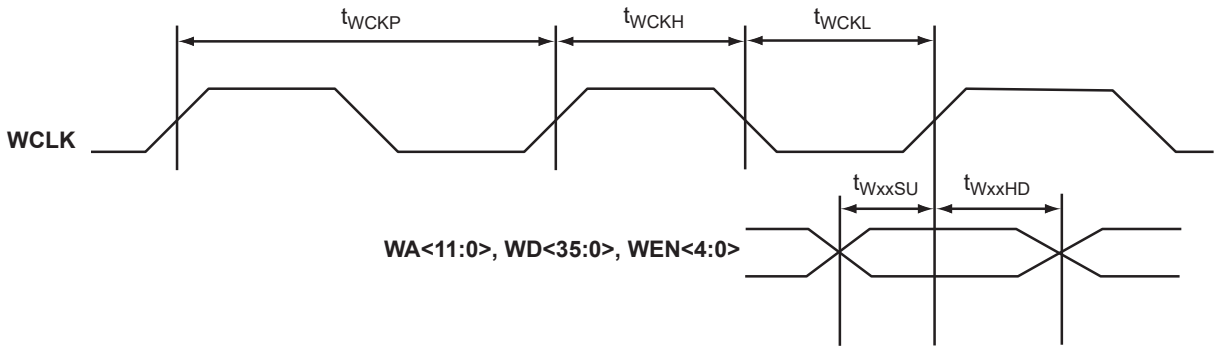


Figure 2-61. RAM Read Timing Waveforms

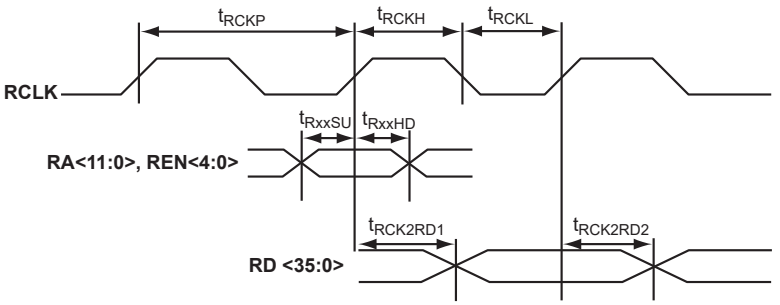

The following tables list the timing characteristics of different RAM blocks.

Table 2-93. One RAM Block Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2 Speed		–1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
Write Mode								
t_{WDASU}	Write data setup vs. WCLK	—	1.08	—	1.23	—	1.45	ns

Note: Timing data for these sixteen cascaded RAM blocks uses a depth of 65,536. For all other combinations, use Microchip's timing software.

2.10.5 FIFO

Every memory block has its own embedded FIFO controller. Each FIFO block has one read port and one write port. This embedded FIFO controller uses no internal FPGA logic and features.

- Glitch-free FIFO Flags
- Gray-code address counters/pointers to prevent metastability problems
- Overflow and underflow control

Both ports are configurable in various sizes from 4k x 1 to 128 x 36, similar to the RAM block size. Each port is fully synchronous.

Read and write operations can be completely independent. Data on the appropriate WD pins are written to the FIFO on every active WCLK edge as long as WEN is high. Data is read from the FIFO and output on the appropriate RD pins on every active RCLK edge as long as REN is asserted.

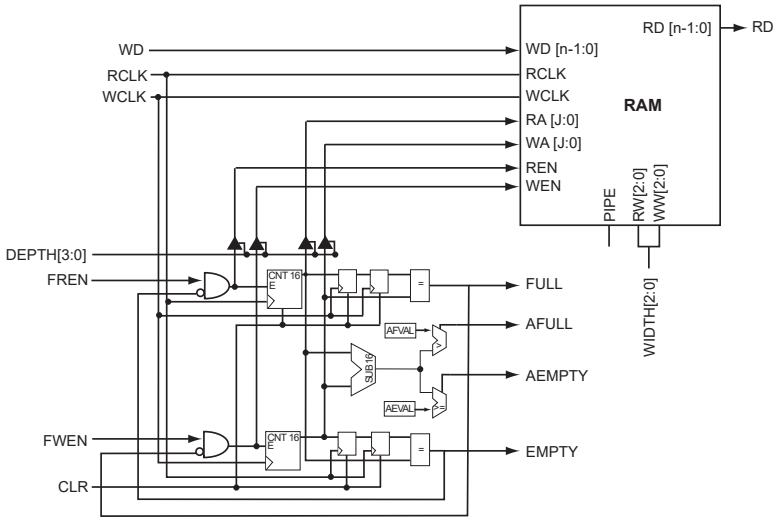
The FIFO block offers programmable almost-empty (AEMPTY) and almost-full (AFULL) flags as well as EMPTY and FULL flags (see the following figure):

- The FULL flag is synchronous to WCLK. It allows the FIFO to inhibit writing when full.
- The EMPTY flag is synchronous to RCLK. It allows the FIFO to inhibit reading at the empty condition.

Gray code counters are used to prevent metastability problems associated with flag logic. The depth of the FIFO is dependent on the data width and the number of memory blocks used to create the FIFO. The write operations to the FIFO are synchronous with respect to the WCLK, and the read operations are synchronous with respect to the RCLK.

The FIFO block may be reset to the empty state.

Figure 2-62. Axcelerator RAM with Embedded FIFO Controller



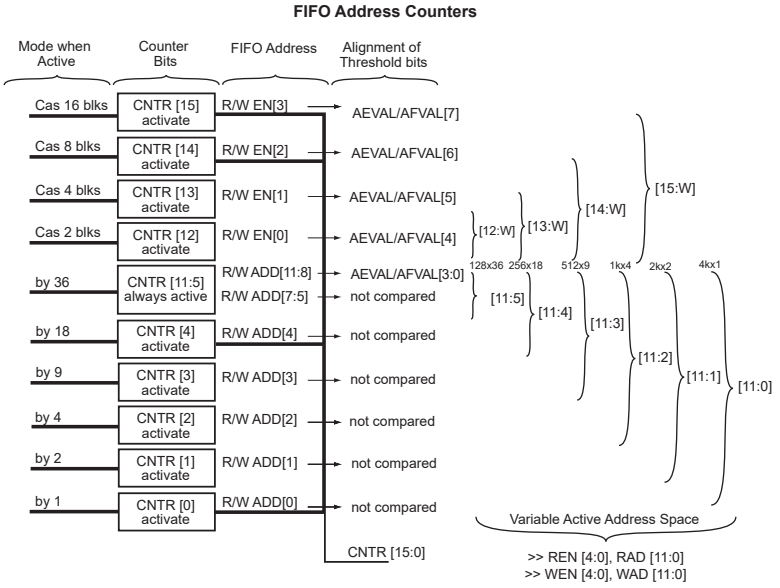
2.10.6 FIFO Flag Logic

The FIFO is user configurable into various DEPTHs and WIDTHs. The following figure shows the FIFO address counter details.

- Bits 11 to 5 are active for all modes
- As the data word size is reduced, more least-significant bits are added to the address
- As the number of cascaded blocks increases, the number of significant bits in the address increases

For example, if four blocks are cascaded as a 1kx16 FIFO with each block having a 1kx4 aspect ratio, bits 11 to 2 of the address will be used to specify locations within each RAM block, whereas bits 13 and 12 will be used to specify the RAM block.

Figure 2-63. FIFO Address Counters



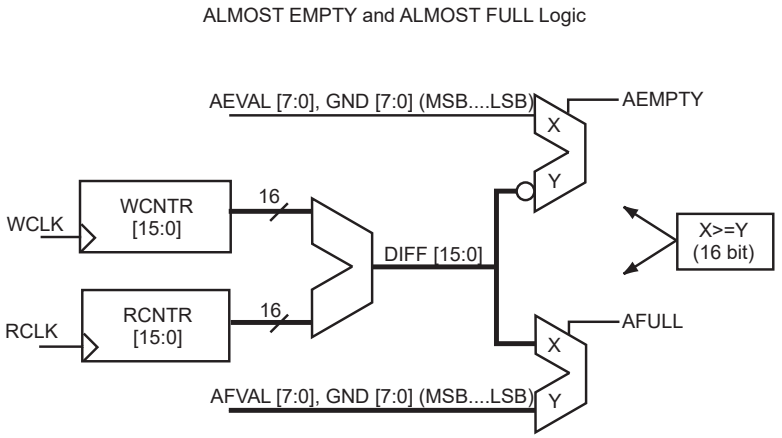
The AFULL and AEMPTY flag threshold values are programmable. The threshold values are AFVAL and AEVAL, respectively. Although the trigger threshold for each flag is defined with eight bits, the effective number of threshold bits in the comparison depends on the configuration. The effective number of threshold bits corresponds to the range of active bits in the FIFO address space (see the following table).

Table 2-98. FIFO Flag Logic

Mode	Inactive AEVAL/AFVAL Bits	Inactive DIFF Bits (set to 0)	DIFF Comparison to AFVAL/AEVAL
Non-cascade	[7:4]	[15:12]	DIFF[11:8] withAE/FVAL[3:0]
Cascade 2 blocks	[7:5]	[15:13]	DIFF[12:8] withAE/FVAL[4:0]
Cascade 4 blocks	[7:6]	[15:14]	DIFF[13:8] withAE/FVAL[5:0]
Cascade 8 blocks	[7]	[15]	DIFF[14:8] withAE/FVAL[6:0]
Cascade 16 blocks	None	None	DIFF[15:8] withAE/FVAL[7:0]

The following figure illustrates flag generation.

Figure 2-64. ALMOST-EMPTY and ALMOST-FULL Logic



The Verilog codes for the flags are:

```
assign AF = (DIFF[15:0] >={AFVAL[7:0],8'b00000000})?1:0;
assign AE = ({AEVAL[7:0],8'b00000000}>=DIFF[15:0])?1:0;
```

The number of DIFF-bits active depends on the configuration depth and width (see the following table).

Table 2-99. Number of Available Configuration Bits

Number of Blocks	Block DxW	Number of AEVAL/AFVAL Bits
1	1x1	4
2	1x2	4
2	2x1	5
4	1x4	4
4	2x2	5
4	4x1	6
8	1x8	4
8	2x4	5
8	4x2	6
8	8x1	7
16	1x16	4
16	2x8	5
16	4x4	6
16	8x2	7
16	16x1	8

The active-high CLR pin is used to reset the FIFO to the empty state, which sets FULL and AFULL low, and EMPTY and AEMPTY high.

Assuming that the EMPTY flag is not set, new data is read from the FIFO when REN is valid on the active edge of the clock. Write and read transfers are described with timing requirements in Timing Characteristics .

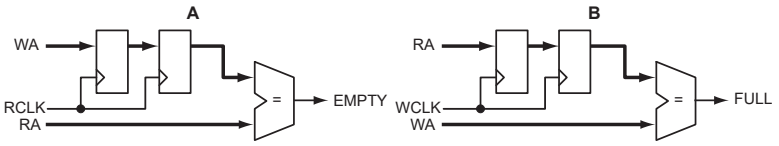
2.10.7 Glitch Elimination

An analog filter is added to each FIFO controller to guarantee glitch-free FIFO-flag logic.

2.10.8 Overflow and Underflow Control

The counter MSB keeps track of the difference between the read address (RA) and the write address (WA). The EMPTY flag is set when the read and write addresses are equal. To prevent underflow, the write address is double-sampled by the read clock prior to comparison with the read address (part A in following figure). To prevent overflow, the read address is double-sampled by the write clock prior to comparison to the write address (part B in the following figure).

Figure 2-65. Overflow and Underflow Control



2.10.9 FIFO Configurations

Unlike the RAM, the FIFO's write width and read width cannot be specified independently. For the FIFO, the write and read widths must be the same. The WIDTH pins are used to specify one of six allowable word widths, as shown in the following table.

Table 2-100. FIFO Width Configurations

WIDTH (2:0)	W x D
000	1 x 4k
001	2 x 2k
010	4 x 1k
011	9 x 512
100	18 x 256
101	36 x 128
11x	reserved

The DEPTH pins allow RAM cells to be cascaded to create larger FIFOs. The four pins allow depths of 2, 4, 8, and 16 to be specified. Table 2-90 describes the FIFO depth options for various data width and memory blocks.

2.10.10 Cascading FIFO Blocks

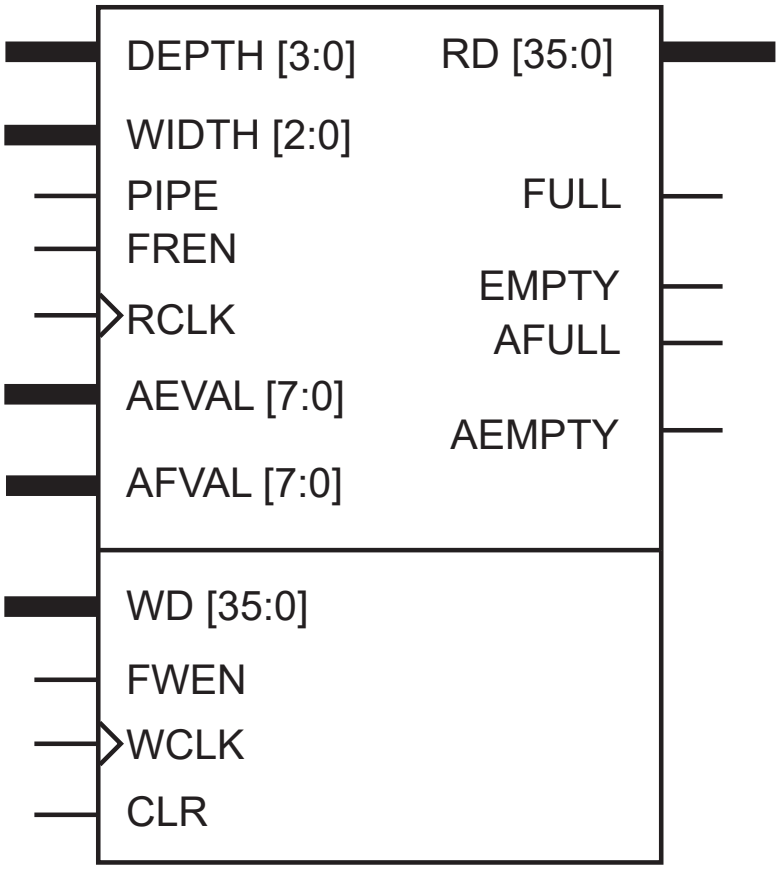
FIFO blocks can be cascaded to create deeper FIFO functions. When building larger FIFO blocks, if the word width can be fractured in a multi-bit FIFO, the fractured word configuration is recommended over a cascaded configuration. For example, 256x36 can be configured as two blocks of 256x18. This should be taken into account when, building the FIFO blocks manually. However, when using SmartGen, the user only needs to specify the depth and width of the necessary FIFO blocks. SmartGen automatically configures these blocks to optimize performance.

2.10.11 Clock

As with RAM configuration, the RCLK and WCLK pins have independent polarity selection.

The following figure shows a logic block diagram of the Axcelerator FIFO module.

Figure 2-66. FIFO Block Diagram



The following table lists the FIFO signals and their descriptions.

Table 2-101. FIFO Signal Description

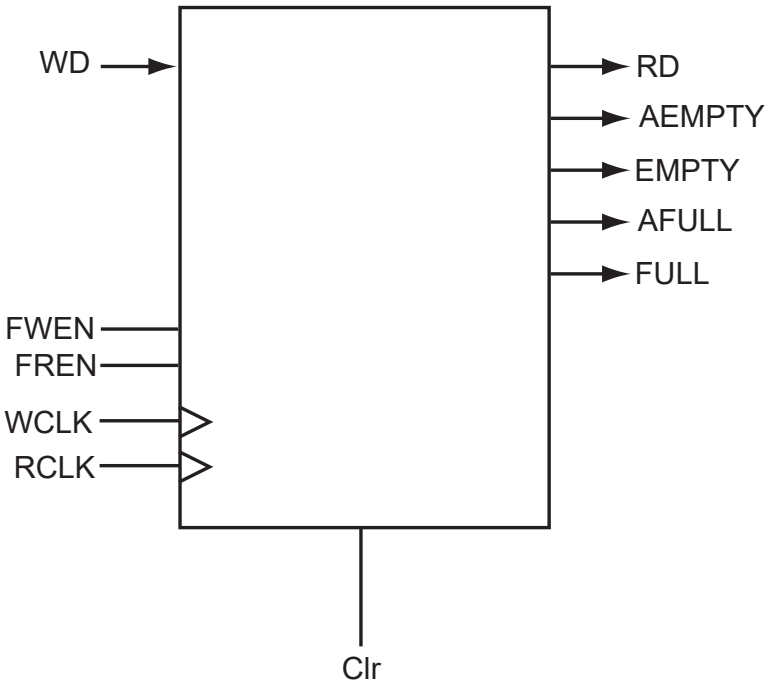
Signal	Direction	Description
WCLK	Input	Write clock (active either edge)
FWEN	Input	FIFO write enable. When this signal is asserted, the WD bus data is latched into the FIFO, and the internal write counters are incremented.
WD[N-1:0]	Input	Write data bus. The value N is dependent on the RAM configuration and can be 1, 2, 4, 9, 18, or 36.
FULL	Output	Active high signal indicating that the FIFO is FULL. When this signal is set, additional write requests are ignored.
AFULL	Output	Active high signal indicating that the FIFO is AFULL
AFVAL	Input	8-bit input defining the AFULL value of the FIFO
RCLK	Input	Read clock (active either edge)
FREN	Input	FIFO read enable
RD[N-1:0]	Output	Read data bus. The value N is dependent on the RAM configuration and can be 1, 2, 4, 9, 18, or 36.
EMPTY	Output	Empty flag indicating that the FIFO is EMPTY. When this signal is asserted, attempts to read the FIFO will be ignored.
AEMPTY	Output	Active high signal indicating that the FIFO is AEMPTY
AEVAL	Input	8-bit input defining the almost-empty value of the FIFO
PIPE	Input	Sets the pipe option on or off
CLR	Input	Active high clear input

.....continued		
Signal	**Direction**	**Description**
DEPTH	Input	Determines the depth of the FIFO and the number of FIFOs to be cascaded
WIDTH	Input	Determines the width of the dataword/FIFO, and the number of the FIFOs to be cascaded

2.10.11.1 Timing Characteristics

The following figure shows the timing model of FIFO.

Figure 2-67. FIFO Model



The following figures show the timing waveforms of FIFO write and FIFO read.

Figure 2-68. FIFO Write Timing Waveform

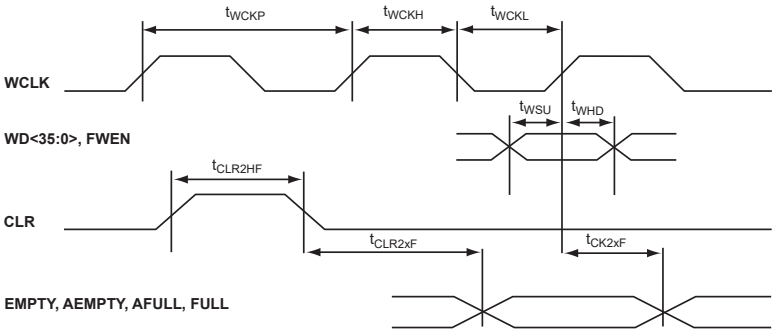


Figure 2-69. FIFO Read Timing Waveform

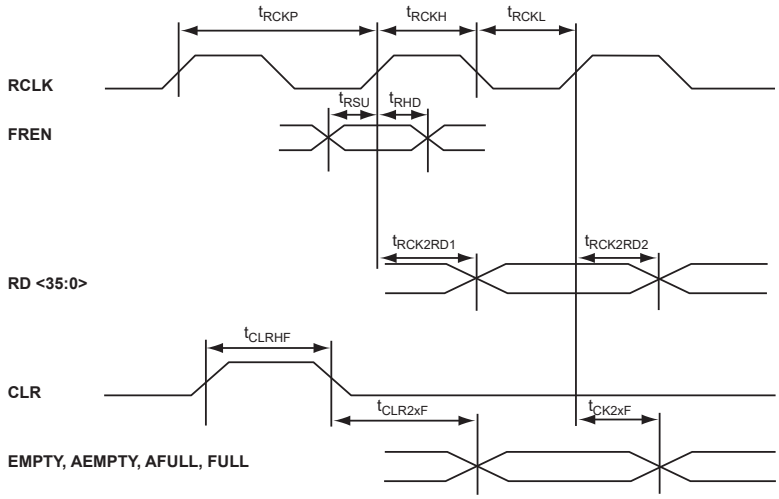

The following tables list the timing characteristics of different FIFO blocks.

Table 2-102. One FIFO Block Worst-Case Commercial Conditions VCCA = 1.425V, VCCI = 3.0V, T_J = 70 °C

Parameter	Description	–2Speed		–1Speed		StdSpeed		Units
		Min.	Max.	Min.	Max.	Min.	Max.

$t_{RCK2RD1}$	RCLK-to-OUT (Pipelined)	12.08		13.76		16.17		ns
$t_{RCK2RD2}$	RCLK-to-OUT (Non-Pipelined)	12.83		14.62		17.18		ns

Note: Timing data for these sixteen cascaded FIFO blocks uses a depth of 65,536. For all other combinations, use Microchip's timing software.

2.10.12 Building RAM and FIFO Modules

RAM and FIFO modules can be generated and included in a design in two different ways:

- Using the SmartGen Core Generator where the user defines the depth and width of the FIFO/RAM, and then instantiates this block into the design (for more information, see the SmartGen, FlashROM, Analog System Builder, and Flash Memory System Builder User's Guide).
- The alternative is to instantiate the RAM/FIFO blocks manually, using inverters for polarity control and tying all unused data bits to ground.

2.11 Other Architectural Features

2.11.1 Low Power Mode

Although designed for high performance, the AX architecture also allows the user to place the device into a low power mode. Each I/O bank in an Axcelerator device can be configured individually, when in low power mode, to tristate all outputs, disable inputs, or both. The low power mode is activated by asserting the LP pin, which is grounded in normal operation.

While in the low power mode, the device is still fully functional and all internal logic states are preserved. This allows a user to disable all but a few signals and operate the part in a low-frequency, watchdog mode if desired. If the I/O bank is not disabled, differential I/Os belonging to the I/O bank will still consume normal power, even when operating in the low power mode.

The Axcelerator device will resume normal operation 10 µs after the LP pin is pulled Low.

To further reduce power consumption, the internal charge pump can be bypassed and an external power supply voltage can be used instead. This saves the internal charge-pump operating current, resulting in no DC current draw. The Axcelerator family devices have a dedicated "VPUMP" pin that can be used to access an external charge pump device. In normal chip operation, when using the internal charge pump, VPUMP should be tied to GND. When the voltage level on VPUMP is set to 3.3V, the internal charge pump is turned off, and the VPUMP voltage will be used as the charge pump voltage. Adequate voltage regulation (that is, high drive, low output impedance, and good decoupling) should be used at VPUMP.

In addition, any PLL in use can be powered down to further reduce power consumption. This can be done with the PowerDown pin driven Low. Driving this pin High restarts the PLL with the output clock(s) being stable once lock is restored.

2.11.2 JTAG

Axcelerator offers a JTAG interface that is compliant with the IEEE 1149.1 standard. The user can employ the JTAG interface for probing a design and performing any JTAG Public Instructions as defined in the following table.

Table 2-107. JTAG Instruction Code

Instruction (IR4:IR0)	Binary Code
Extest	00000
Preload/Sample	00001
Intest	00010
USERCODE	00011
IDCODE	00100
HIGHZ	01110
CLAMP	01111
Diagnostic	10000

.....continued	
Instruction (IR4:IR0)	**Binary Code**
Reserved	All others
Bypass	11111

2.11.3 Interface

The interface consists of four inputs: Test Mode Select (TMS), Test Data In (TDI), Test Clock (TCK), TAP Controller Reset (TRST), an output, and Test Data Out (TDO). TMS, TDI, and TRST have on-chip pull-up resistors.

2.11.3.1 TRST

Test-Logic Reset (TRST) is an active-low, asynchronous reset signal to the TAP controller. The TRST input can be used to reset the Test Access Port (TAP) Controller to the TRST state. The TAP Controller can be held at this state permanently by grounding the TRST pin. To hold the JTAG TAP controller in the TRST state, it is recommended to connect TRST to ground via a 1 kΩ resistor.

There is an optional internal pull-up resistor available for the TRST input that can be set by the user at programming. Care should be exercised when using this option in combination with an external tie-off to ground.

An on-chip Power-On-Reset (POWRST) circuit is included. POWRST has the same function as TRST, but it only occurs at power-up or during recovery from a VCCA and/or VCCDA voltage drop.

2.11.3.2 TDO

TDO is normally tristated, and it is active only when the TAP controller is in the “Shift_DR” state or “Shift_IR” state. The least significant bit of the selected register (that is, IR or DR) is clocked out to TDO first by the falling edge of TCK.

2.11.3.3 TAP Controller

The TAP Controller is compliant with the IEEE Standard 1149.1. It is a state machine of 16 states that controls the Instruction Register (IR) and the Data Registers (such as BSR, IDCODE, USRCODE, BYPASS, and so on.). The TAP Controller steps into one of the states depending on the sequence of TMS at the rising edges of TCK.

2.11.3.4 Instruction Register (IR)

The IR has five bits (IR4 to IR0). At the TRST state, IR is reset to IDCODE. Each time when IR is selected, it goes through “select IR-Scan,” “Capture-IR,” “Shift-IR,” all the way through “Update-IR.” When there is no test error, the first five data bits coming out of TDO during the “Shift-IR” will be “10111”. If a test error occurs, the last three bits will contain one to three zeroes corresponding to negatively asserted signals: “TDO_ERRORB,” “PROBA_ERRORB,” and “PROBB_ERRORB.” The error(s) will be erased when the TAP is at the “Update-IR” or the TRST state. When in user mode start-up sequence, if the micro-probe has not been used, the “PROBA_ERRORB” is used as a “Power-up done successfully” flag.

2.11.3.5 Data Registers (DRs)

Data registers are distributed throughout the chip. They store testing/programming vectors. The MSB of a data register is connected to TDI, while the LSB is connected to TDO. There are different types of data registers. Descriptions of the main registers are as follow:

IDCODE:

The IDCODE is a 20-bit hard coded JTAG Silicon Signature. It is a hardwired device ID code, which contains the Microchip identity, part number, and version number in a specific JTAG format.

USERCODE:

The USERCODE is a 33-bit programmable register. However, only 20 bits are allocated to use as JTAG Silicon Signature. It is a supplementary identity code for the user to program information

to distinguish different programmed parts. USERCODE fuses will read out as “zeroes” when not programmed, so only the “1” bits need to be programmed.

Boundary-Scan Register (BSR):

Each I/O contains three Boundary-Scan Cells. Each cell has a shift register bit, a latch, and two MUXes. The boundary-scan cells are used for the Output-enable (E), Output (O), and Input (I) registers. The bit order of the boundary-scan cells for each of them is E-O-I. The boundary-scan cells are then chained serially to form the Boundary-Scan Register (BSR). The length of the BSR is the number of I/Os in the die multiplied by three.

Bypass Register (BYR):

This is the “1-bit” register. It is used to shorten the TDI-TDO serial chain in board-level testing to only one bit per device not being tested. It is also selected for all “reserved” or unused instructions.

2.11.3.6 Probing

Internal activities of the JTAG interface can be observed via the Silicon Explorer II probes: “PRA,” “PRB,” “PRC,” and “PRD.”

2.11.4 Special Fuses

2.11.4.1 Security

Microchip antifuse FPGAs, with FuseLock technology, offer the highest level of design security available in a programmable logic device. Since antifuse FPGAs are live-at power-up, there is no bitstream that can be intercepted, and no bitstream or programming data is ever downloaded to the device during power-up, thus protecting against device cloning. In addition, special security fuses are hidden throughout the fabric of the device and may be programmed by the user to thwart attempts to reverse engineer the device by attempting to exploit either the programming or probing interfaces. Both invasive and noninvasive attacks against an Axcelerator device that access or bypass these security fuses will destroy access to the rest of the device. (see the Design Security in Nonvolatile Flash and Antifuse FPGAs white paper).

Look for the following symbol to ensure your valuable IP is protected with highest level of security in the industry.

Figure 2-70. FuseLock Logo

To ensure maximum security in Axcelerator devices, it is recommended that the user program the device security fuse (SFUS). When programmed, the Silicon Explorer II testing probes are disabled to prevent internal probing, and the programming interface is also disabled. All JTAG public instructions are still accessible by the user.

2.11.4.2 Global Set Fuse

The Global Set Fuse determines if all R-cells and I/O registers (InReg, OutReg, and EnReg) are either cleared or preset by driving the GCLR and GPSET inputs of all R-cells and I/O Registers (see Figure 2-32). Default setting is to clear all registers (GCLR = 0 and GPSET =1) at device power-up. When the GBSETFUS option is checked during FUSE file generation, all registers are preset (GCLR = 1 and GPSET= 0). A local CLR or PRESET will take precedence over this setting. Both pins are pulled High during normal device operation. For use details, see the Libero IDE online help.

2.11.5 Silicon Explorer II Probe Interface

Silicon Explorer II is an integrated hardware and software solution that, in conjunction with the Designer tools, allows users to examine any of the internal nets (except I/O registers) of the device

while it is operating in a prototype or a production system. The user can probe up to four nodes at a time without changing the placement and routing of the design and without using any additional device resources. Highlighted nets in Designer's ChipPlanner can be accessed using Silicon Explorer II in order to observe their real time values.

Silicon Explorer II's noninvasive method does not alter timing or loading effects, thus shortening the debug cycle. In addition, Silicon Explorer II does not require relayout or additional MUXes to bring signals out to external pins, which is necessary when using programmable logic devices from other suppliers. By eliminating multiple place-and-route program cycles, the integrity of the design is maintained throughout the debug process.

Each member of the Axcelerator family has four external pads: PRA, PRB, PRC, and PRD. These can be used to bring out four probe signals from the Axcelerator device (note that the AX125 only has two probe signals that can be observed: PRA and PRB). Each core tile has up to two probe signals. To disallow probing, the SFUS security fuse in the silicon signature has to be programmed (see Special Fuses).

Silicon Explorer II connects to the host PC using a standard serial port connector. Connections to the circuit board are achieved using a nine-pin D-Sub connector (see Figure 1-9). Once the design has been placed-and-routed, and the Axcelerator device has been programmed, Silicon Explorer II can be connected and the Explorer software can be launched.

Silicon Explorer II comes with an additional optional PC hosted tool that emulates an 18-channel logic analyzer. Four channels are used to monitor four internal nodes, and 14 channels are available to probe external signals. The software included with the tool provides the user with an intuitive interface that allows for easy viewing and editing of signal waveforms.

2.12 Programming

Device programming is supported through the Silicon Sculptor II, a single-site, robust and compact device programmer for the PC. Up to four Silicon Sculptor IIs can be daisy-chained and controlled from a single PC host. With standalone software for the PC, Silicon Sculptor II is designed to allow concurrent programming of multiple units from the same PC when daisy-chained.

Silicon Sculptor II programs devices independently to achieve the fastest programming times possible. Each fuse is verified by Silicon Sculptor II to ensure correct programming. Furthermore, at the end of programming, there are integrity tests that are run to ensure that programming was completed properly. Not only does it test programmed and nonprogrammed fuses, Silicon Sculptor II also provides a self-test to test its own hardware extensively.

Programming an Axcelerator device using Silicon Sculptor II is similar to programming any other antifuse device. The procedure is as follows:

Load the *.AFM file.

Select the device to be programmed.

Begin programming.

When the design is ready to go to production, Microchip offers device volume-programming services either through distribution partners or via our In-House Programming Center.

In addition, BP Microsystems offers multi-site programmers that provide qualified support for Axcelerator devices.

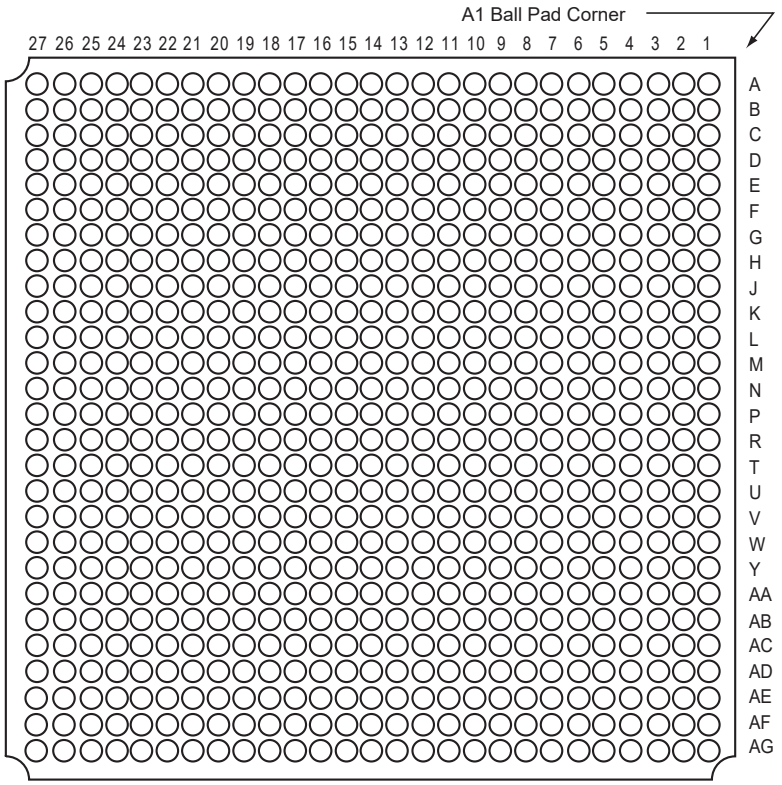
For more details on programming the Axcelerator devices, see the Silicon Sculptor II User's Guide.

3. Package Pin Assignments

3.1 BG729

The following figure shows package bottom-view of BG729.

Figure 3-1. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following table lists the IOD interface pin placement.

Table 3-1. Packaging Pin Assignment Table (PPAT)

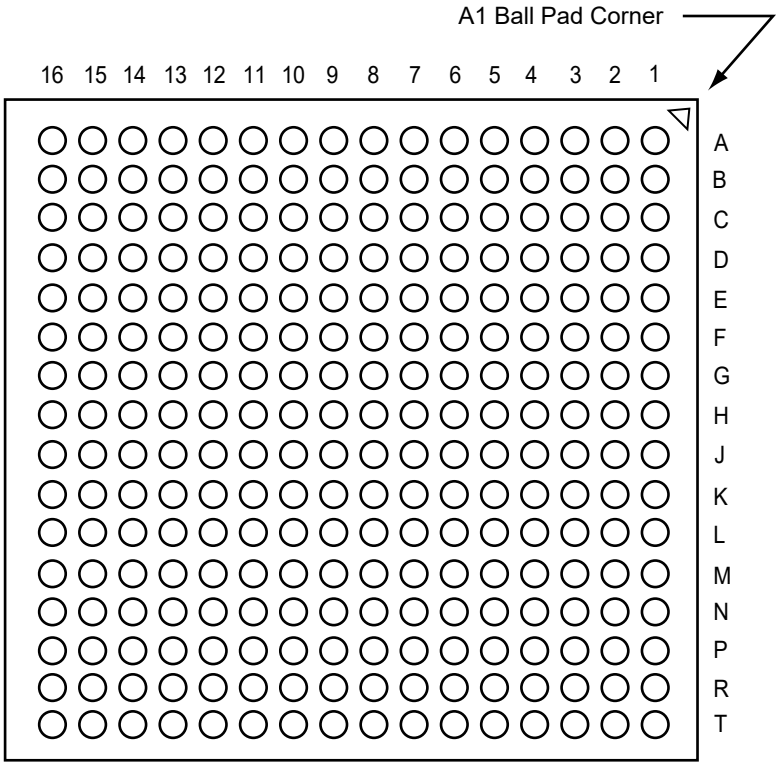
3.2 FG256

The following figure shows package bottom-view of FG256.

Figure 3-2. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following tables list the IOD interface pin placement.

Table 3-2. Packaging Pin Assignment Table (PPAT)

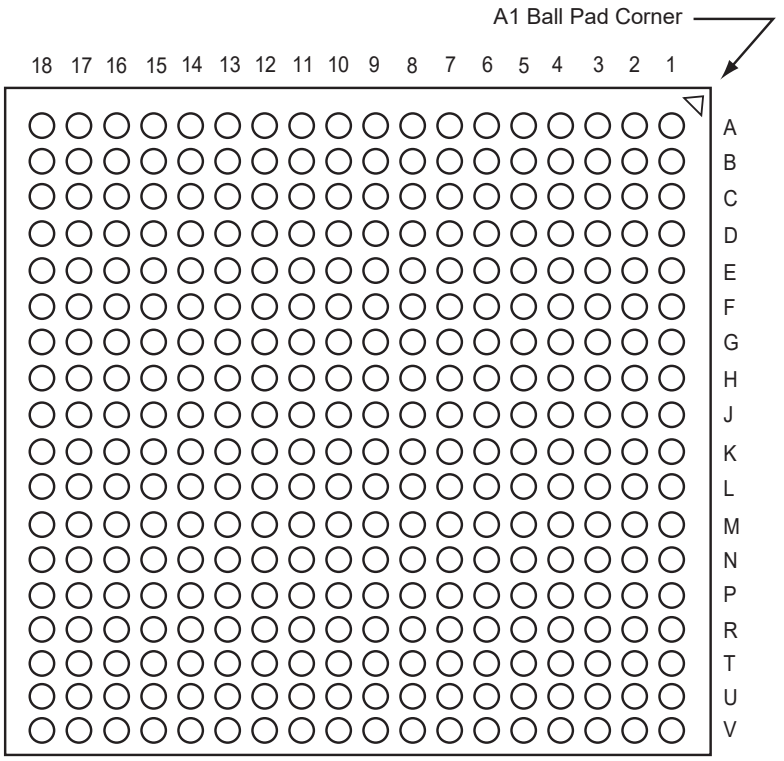
3.3 FG324

The following figure shows package bottom-view of FG324.

Figure 3-3. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following table lists the IOD interface pin placement.

Table 3-4. Packaging Pin Assignment Table (PPAT)

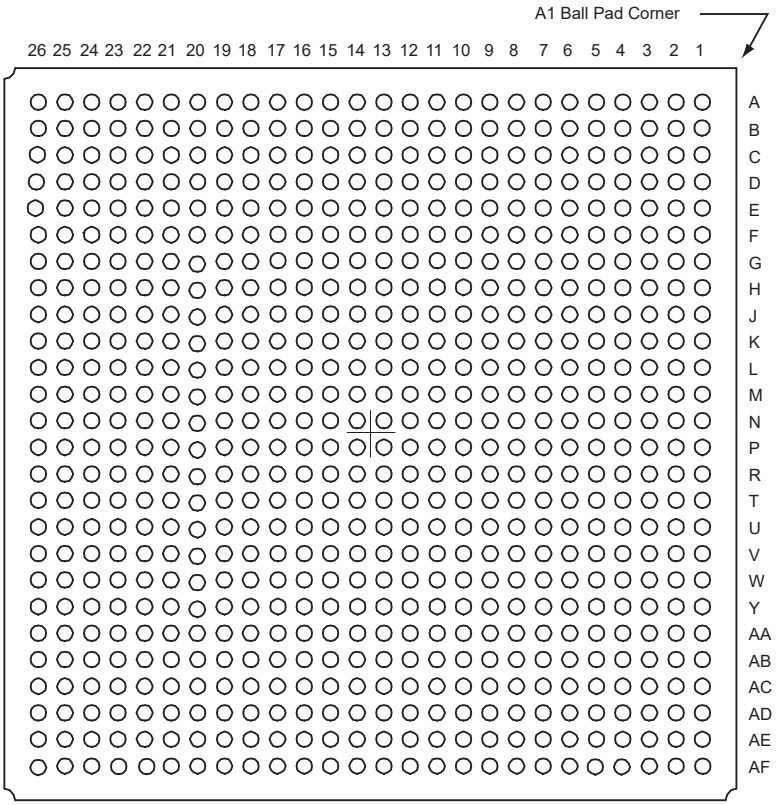
3.5 FG676

The following figure shows package bottom-view of FG676.

Figure 3-5. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following tables list the IOD interface pin placement.

Table 3-8. Packaging Pin Assignment Table (PPAT)

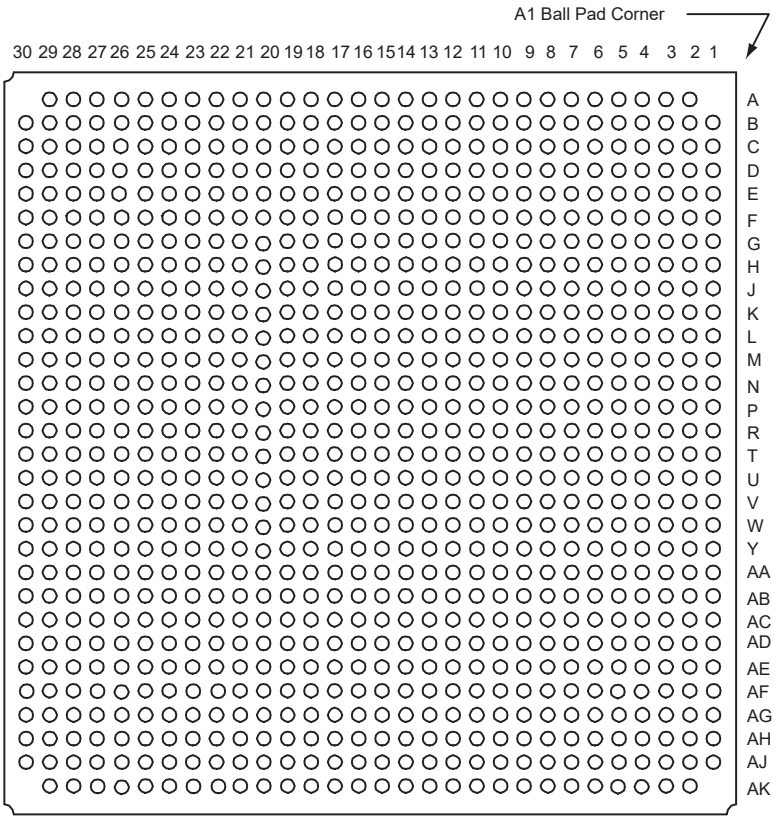
3.6 FG896

The following figure shows package bottom-view of FG896.

Figure 3-6. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following tables list the IOD interface pin placement.

Table 3-10. Packaging Pin Assignment Table (PPAT)

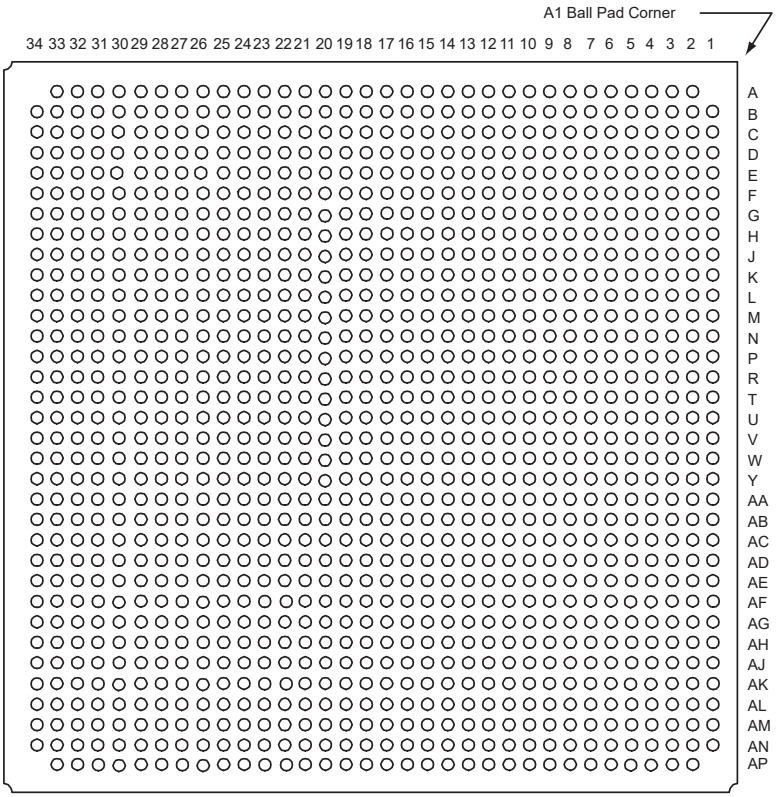
Note:

1. Not routed on the same package layer and to adjacent LGA pads as its differential pair complement. Recommended to be used as a single-ended I/O.

3.7 FG1152

The following figure shows package bottom-view of FG1152.

Figure 3-7. Package Bottom-View



Note: For Package Manufacturing and Environmental information, visit Resource center at www.microchip.com/en-us/support/package-drawings/fpga-packaging.

The following table lists the IOD interface pin placement.

Table 3-12. Packaging Pin Assignment Table (PPAT)

Note:

1. Not routed on the same package layer and to adjacent LGA pads as its differential pair complement. Recommended to be used as a single-ended I/O.

4. Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

Table 4-1. Revision History

Revision	Date	Description
A	10/2024	The following is the list of changes in revision A of the document: • Migrated this document into Microchip template and updated the Microsemi links with Microchip links. • Updated document number to DS50003755A from 5172160. • Device AX125 has been discontinued in Table 1, Table 2, Table 3, and Table 4. • Package FG676 and CQ352 has been discontinued for device AX500 Table 1, Table 2, and Table 4. • Package FG896 and CG624 has been discontinued for device AX1000 Table 1, Table 2, and Table 4. • Package FG1152 has been discontinued for device AX2000 Table 1, Table 2, and Table 4. • In Table 2-2, under Parameter Range, Ambient temperature is changed to Junction temperature. • In Package Pin Assignments, for AX2000 device in CG624 package pin, E8 function has been updated from GND to GND/LP.
18	03/2012	The following is the list of changes in revision 18 of the document: • Updated Table 2-1 to correct the maximum DC core supply voltage (VCCA) from 1.6 V to 1.7 V (SAR 36786). The maximum input voltage (VI) was corrected from 3.75 V to 4.1 V (SAR 35419). • Added values for tristate leakage current IOZ, and IIH and IIL in table Table 2-3 (SARs 35774, 32021). • Figure 2-2 was updated to correct the units for the resistance from "W" to Ω (SAR 36415). • In User I/Os2 section, the following sentence was added to clarify the slew rate setting (SAR 34943): The slew rate setting is effective for both rising and falling edges. • Figure 2-3 was revised to show the VCCI and GND clamp diodes. The explanatory text above the figure was revised as well (SAR 34942). • Equation for 5 V tolerance was corrected to change Vdiode from 0.6 V to 0.7 V (SAR 36786). • Additional information was added to the Using the Weak Pull-Up and Pull-Down Circuits section to clarify how the weak pull-up and pull-down resistors are physically implemented (SAR 34945). • The description for the CINCLK parameter in Table 2-23 was changed from "Input capacitance on clock pin" to "Input capacitance on HCLK and RCLK pin" (SAR 34944). • Table 2-24 is new (SAR 34942). • The minimum VIL for 1.5 V LVCMOS and PCI was corrected from –0.5 to –0.3 in Table 2-34 and Table 2-37 (SAR 34358). • Support for simulating the GCLR/ GPSET feature in the Axcelerator Family was added in Libero software v9.0 SPI1. Reference to the section explaining this in the Antifuse Macro Library Guide was added to the R-Cell (SAR 26413). • The enable signal in Figure 2-33 was corrected to show it is active low rather than active high (SAR 34946).

.....continued

Revision	Date	Description
17	09/2011	The following is the list of changes in revision 17 of the document: • The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The Axcelerator Family Device Status table indicates the status for each device in the device family. • The Features section, Programmable Interconnect Element section, and Security section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865). • The C180 package was removed from product tables and the Package Pin Assignments section (PDN 0909). • Package names used in the Table 1 and Package Pin Assignments section were revised to match standards given in Package Mechanical Drawings (SAR 27395). • The section User I/Os2 was updated as follows: "The user does not need to assign VREF pins for OUTBUF and TRIBUF. VREF pins are needed only for input and bidirectional I/Os" (SARs 24181, 24309). • Power values in Table 2-4 were updated to reflect those of SmartPower (SAR 33945). • Two parameter names were corrected in Figure 2-10. One occurrence of tENLZ was changed to tENZL and one occurrence of tENHZ was changed to tENZH (SAR 33890). • The Timing Model section was updated with new timing values. Timing tables in the I/O Specifications section were updated to include enable paths. Values in the timing tables in the Voltage-Referenced I/O Standards section and Differential Standards section were updated. • Table 2-67 was updated (SAR 33945). • Figure 2-11 was replaced (SAR 33043). • The timing tables for RAM and FIFO were updated (SAR 33945). • "Data Registers (DRs)" values were modified for IDCODE and USERCODE (Data Registers (DRs) SARs 18257, 26406). • The package diagram for the CQ208 package was incorrect and has been replaced with the correct diagram (SARs 23865, 26345).
16	10/2010	The following is the list of changes in revision 16 of the document: • The datasheet was updated to include AX2000-CQ2526 information. • MIL-STD-883 Class B is no longer supported by Axcelerator FPGAs and as a result was removed. • A footnote was added to the Axcelerator Clock Management System section.
15	11/2008	The following is the list of changes in revision 15 of the document: • RoHS-compliant information was added to the Ordering Information. • ACTgen was changed to SmartGen because ACTgen is obsolete.
14	—	The following is the list of changes in revision 14 of the document: • In Table 2-4, the units for the PLOAD, P10, and PI/O were updated from mW/MHz to mW/MHz. • In the Pin Descriptions section, the HCLK and CLK descriptions were updated to include tie-off information. • The Global Resource Distribution section was updated. • The CG624 table was updated.
13	—	The following is the list of changes in revision 13 of the document: • A note was added to Table 2-2. • In the Package Thermal Characteristics, the temperature was changed from 150°C to 125°C.
12	—	The following is the list of changes in revision 12 of the document: • Revised Ordering Information and timing data to reflect phase out of –3 speed grade options. • Table 2-3 was updated.

.....continued

Revision	Date	Description
11	—	The following is the list of changes in revision 11 of the document: • The Packaging Data section is new. • Table 2-2 was updated. • Table 2-8 was updated. • Table 2-11 was updated. • The User I/Os2 was updated.
10	—	The following is the list of changes in revision 10 of the document: • Figure 1-3 was updated. • Table 2-2 was updated. • The Power-Up/Down Sequence section was updated. • Table 2-4 was updated. • Table 2-5 was updated. • The Timing Characteristics section was added. • Table 2-7 was updated. • Figure 2-1 was updated. • The External Setup and Clock-to-Out (Pad-to-Pad) equations in the Hardwired Clock—Using LVTTL 24 mA High Slew Clock I/O section were updated. • The External Setup and Clock-to-Out (Pad-to-Pad) in the Routed Clock—Using LVTTL 24 mA High Slew Clock I/O section were updated. • The Global Pins section was updated. • The User I/Os2 section was updated. • Table 2-22 was updated. • Figure 2-8 was updated. • Figure 2-13 and Figure 2-14 were updated. • The following timing parameters were renamed in I/O timing characteristic tables from Table 2-27 to Table 2-64: tIOCLKQ > tICLKQ tIOCLKY > tOCLKQ • Timing numbers were updated from Table 2-27 to Table 2-82. • The R-Cell section was updated. • Figure 2-60 was updated. • Figure 2-61 was updated. • Figure Figure 2-68 was updated. • Figure 2-69 was updated. • Table 2-93 to Table 2-97 were updated. • Table 2-102 to Table 2-106 were updated. • The TRST section was updated. • The Global Set Fuse section was added. • A footnote was added to FG896 for the AX2000 regarding pins AB1, AE2, G1, and K2. • Pinouts for the AX250, AX500, and AX1000 were added for CQ352. • Pinout for the AX1000 was added for CG624.
9.0	—	The following is the list of changes in revision 9.0 of the document: • Table 2-83 was updated. • The Low Power Mode section was updated.

.....continued

Revision	Date	Description
8.0	—	The following is the list of changes in revision 8.0 of the document: • Table 1 has been updated. • The Ordering Information section has been updated. • The Device Resources section has been updated. • The Temperature Grade Offerings section is new. • The Speed Grade and Temperature Grade Matrix section has been updated. • Table 2-14 has been updated. • Table Table 2-15 has been updated. • Table 2-1 has been updated. • Table 2-2 has been updated. • Table 2-3 has been updated. • Table 2-4 has been updated. • Table 2-5 has been updated. • The Power Estimation Example section has been updated. • The Thermal Characteristics section has been updated. • The Package Thermal Characteristics section has been updated. • The Timing Characteristics section has been updated. • The Pin Descriptions section has been updated. • Timing numbers have been updated from the 3.3V LVTTL section to the Timing Characteristics section. Many AC Loads were updated as well. • Timing characteristics for the Hardwired Clocks and Routed Clocks sections were updated. • Table 2-93 to Table 2-96 and Table 2-102 to Table 2-99 were updated. • The following sections were updated: Low Power Mode, Interface, Data Registers (DRs), Security, Silicon Explorer II Probe Interface, and Programming. • In the PQ208 (AX500) section, pins 2, 52, and 156 changed from VCCDA to VCCA. For pins 170 and 171, the I/O names refer to pair 23 instead of 24. • The following changes were made in the FG676 (AX500) section: AE2, AE25 Change from NC to GND. AF2, AF25 Changed from GND to NC AB4, AF24, C1, C26 Changed from VCCDA to VCCA AD15 Change from VCCDA to VCOMPLE AD17 Changed from VCOMPLE to VCCDA • In the FG896 (AX2000) section, the AK28 changed from VCCIB5 to VCCIB4. • The CQ352 and CG624 sections are new.
7.0	—	The following is the list of changes in revision 7.0 of the document: • All I/O FIFO capability was removed. • Table 1 was updated. • Figure 1-9 was updated. • Figure 2-5 was updated. • The Using an I/O Register section was updated. • The AX250 and AX1000 descriptions were added to the FG484 section.
6.0	—	The following is the list of changes in revision 6.0 of the document: • Table 2-3 was updated. • Figure 2-1 was updated. • Figure 2-49 was updated. • Figure 2-53 was updated.

.....continued

Revision	Date	Description
5.0	—	The following is the list of changes in revision 5.0 of the document: • In the PQ208 table, pin 196 was missing, but it has been added in this version with a function of GND. • The following pins in the FG484 table for AX500 were changed: Pin G7 is GND/LP Pins AB8, C10, C11, C14, AB16 are NC. • The FG676 table was updated.
4.0	—	The following is the list of changes in revision 4.0 of the document: • The Device Resources section was updated for the CS180. • The Programmable Interconnect Element and Figure 1-2 are new. • The "CS180" table is new. • The PQ208 tables for the AX500 were updated. The following pins were not defined in the previous version: GND 21 IO106PB5F10/CLKHP 71 GND 136
3.0	—	The following is the list of changes in revision 3.0 of the document: • Table 1, Ordering Information, Device Resources, and the Product Plan table were updated. • The following figures and tables were updated: – Figure 1-3 – Figure 1-8 – Table 2-3 – Table 2-13 – Figure 2-2 – Figure 2-11 • The Design Environment section was updated. • The Package Thermal Characteristics was updated. • The timing characteristics tables fromTable 2-27 to Table 2-68 were updated. • The Global Resources section was updated. • The timing characteristics tables from Table 2-102 and Table 2-103 were updated. • The PQ208, FG256, and FG324 tables are new.

Microchip Information

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable". Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

Legal Notice

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure

that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at www.microchip.com/en-us/support/design-help/client-support-services.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, TimeCesium, TimeHub, TimePictra, TimeProvider, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, Clockstudio, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, EyeOpen, GridTime, IdealBridge, IGaT, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, IntelliMOS, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, MarginLink, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mSiC, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, Power MOS IV, Power MOS 7, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQI, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, Trusted Time, TSHARC, Turing, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.
