AMIS-30660

High Speed CAN Transceiver

Description

The AMIS−30660 CAN transceiver is the interface between a controller area network (CAN) protocol controller and the physical bus and may be used in both 12 V and 24 V systems. The transceiver provides differential transmit capability to the bus and differential receive capability to the CAN controller.

Due to the wide common−mode voltage range of the receiver inputs, the AMIS−30660 is able to reach outstanding levels of electromagnetic susceptibility (EMS). Similarly, extremely low electromagnetic emission (EME) is achieved by the excellent matching of the output signals.

Features

- Fully Compatible with the ISO 11898−2 Standard
- Certified "Authentication on CAN Transceiver Conformance (d1.1)"
- High Speed (up to 1 Mbit/s)
- Ideally Suited for 12 V and 24 V Industrial and Automotive Applications
- Low EME Common−Mode Choke is No Longer Required
- Differential Receiver with Wide Common−Mode Range (± 35 V) for High EMS
- No Disturbance of the Bus Lines with an Unpowered Node
- Transmit Data (TxD) Dominant Time−out Function
- Thermal Protection
- Bus Pins Protected Against Transients in an Automotive Environment
- Silent Mode in which the Transmitter is Disabled
- Short Circuit Proof to Supply Voltage and Ground
- Logic Level Inputs Compatible with 3.3 V Devices
- These are Pb−Free Devices*

FUNCTIONAL DESCRIPTION

Operating Modes

The behavior of AMIS−30660 under various conditions is illustrated in Table 5 below. In case the device is powered, one of two operating modes can be selected through Pin S.

Table 5. FUNCTIONAL TABLE OF AMIS−30660 (X = DON'T CARE)

VCC	Pin TxD	Pin S	Pin CANH	Pin CANL	Bus State	Pin RxD
4.75 V to 5.25 V	0	0 (or Floating)	High	Low	Dominant	0
4.75 V to 5.25 V	X	1	V_{CC} / 2	V_{CC} / 2	Recessive	1
4.75 V to 5.25 V	1 (or Floating)	X	V_{CC} / 2	V_{CC} / 2	Recessive	1
V_{CC} < PORL (Unpowered)	X	X	0 V < CANH < V_{CC}	0 V < CANL < V_{CC}	Recessive	1
PORL < V_{CC} < 4.75 V	> 2 V	X	0 V < CANH < V_{CC}	0 V < CANL < V_{CC}	Recessive	1

High−Speed Mode

If Pin S is pulled low (or left floating), the transceiver is in its high−speed mode and is able to communicate via the bus lines. The signals are transmitted and received to the CAN controller via the Pins TxD and RxD. The slopes on the bus line outputs are optimized to give extremely low electromagnetic emissions.

Silent Mode

In silent mode, the transmitter is disabled. All other IC functions continue to operate. The silent mode is selected by connecting Pin S to V_{CC} and can be used to prevent network communication from being blocked, due to a CAN controller which is out of control.

Overtemperature Detection

A thermal protection circuit protects the IC from damage by switching off the transmitter if the junction temperature exceeds a value of approximately 160°C. Because the transmitter dissipates most of the power, the power dissipation and temperature of the IC is reduced. All other IC functions continue to operate. The transmitter off−state resets when Pin TxD goes high. The thermal protection circuit is particularly necessary when a bus line short−circuits.

TxD Dominant Time−out Function

A TxD dominant time−out timer circuit prevents the bus lines from being driven to a permanent dominant state (blocking all network communication) if Pin TxD is forced permanently low by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TxD. If the duration of the low−level on Pin TxD exceeds the internal timer value t_{dom}, the transmitter is disabled, driving the bus into a recessive state. The timer is reset by a positive edge on Pin TxD.

Fail−Safe Features

A current−limiting circuit protects the transmitter output stage from damage caused by an accidental short−circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

The Pins CANH and CANL are protected from automotive electrical transients (according to "ISO 7637"; see Figure 3). Pin TxD is pulled high internally should the input become disconnected.

ELECTRICAL CHARACTERISTICS

Definitions

All voltages are referenced to GND (Pin 2). Positive currents flow into the IC. Sinking current means the current is flowing into the pin; sourcing current means the current is flowing out of the pin.
