Purchase and inquiry

Manufacturer Product Number:	Manufacturer:
FS7140-01G-XTD	onsemi
Series:	Product Status:
-	Obsolete
DiGi-Electronics Programmable:	Type:
Not Verified	PLL Clock Generator
PLL:	Input:
Yes	Crystal
Output:	Number of Circuits:
CMOS, PECL	1
Ratio - Input:Output:	Differential - Input:Output:
2:1	No/Yes
Frequency - Max:	Divider/Multiplier:
400MHz	Yes/No
Voltage - Supply:	Operating Temperature:
3V ~ 3.6V	0°C ~ 70°C
Mounting Type:	Package / Case:
Surface Mount	16-SOIC (0.154", 3.90mm Width)
Supplier Device Package:	Base Product Number:
16-SOIC	FS7140

Environmental & Export classification

RoHS Status:	Moisture Sensitivity Level (MSL):
ROHS3 Compliant	2 (1 Year)
REACH Status:	ECCN:
REACH Unaffected	EAR99
HTSUS:	
8542.39.0001	

FS7140, FS7145

Programmable Phase-Locked Loop Clock Generator

ON Semiconductor®

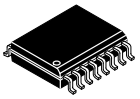
SOIC−16
01 SUFFIX
CASE 751BA



SSOP−16
02 SUFFIX
CASE 565AE

Description

The FS7140 or FS7145 is a monolithic CMOS clock generator/regenerator IC designed to minimize cost and component count in a variety of electronic systems. Via the I^2C−bus interface, the FS7140/45 can be adapted to many clock generation requirements.

The length of the reference and feedback dividers, their fine granularity and the flexibility of the post divider make the FS7140/45 the most flexible stand−alone PLL clock generator available.

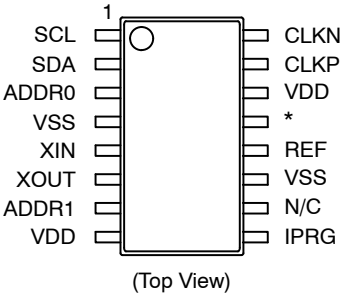
Features

- Extremely Flexible and Low−jitter Phase Locked Loop (PLL) Frequency Synthesis
- No External Loop Filter Components Needed
- 150 MHz CMOS or 340 MHz PECL Outputs
- Completely Configurable via I^2C−bus
- Up to Four FS714x can be Used on a Single I^2C−bus
- 3.3 V Operation
- Independent On−chip Crystal Oscillator and External Reference Input
- Very Low “Cumulative” Jitter
- Pb−Free Packages are Available

Applications

- Precision Frequency Synthesis
- Low−frequency Clock Multiplication
- Video Line−locked Clock Generation
- Laser Beam Printers (FS7145)

PIN CONNECTIONS



(Top View)

* FS7140 pin 13 = N/C
FS7145 pin 13 = SYNC

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 17 of this data sheet.

FS7140, FS7145

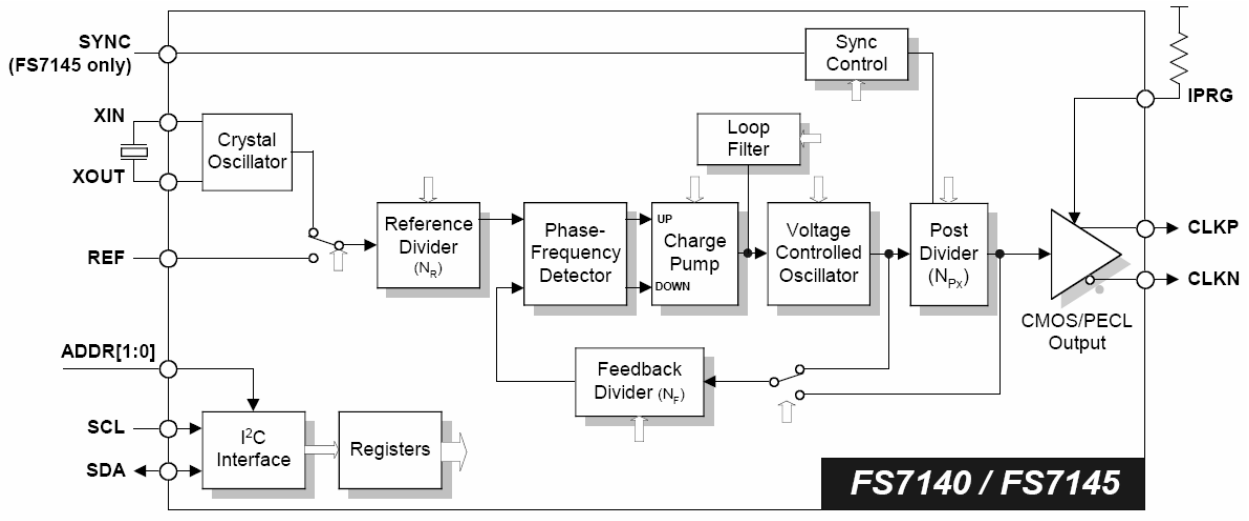


Figure 1. Device Block Diagram

Table 1. PIN DESCRIPTIONS*

Pin	Type	Name	Description
1	DI	SCL	Serial interface clock (requires an external pull−up)
2	DIO	SDA	Serial interface data input/output (requires an external pull−up)
3	DI_D	ADDR0	Address select bit “0”
4	P	VSS	Ground
5	AI	XIN	Crystal oscillator feedback
6	AO	XOUT	Crystal oscillator drive
7	DI_D	ADDR1	Address select bit “1”
8	P	VDD	Power supply (+3.3 V nominal)
9	AI	IPRG	PECL current drive programming
10	−	n/c	No connection
11	P	VSS	Ground
12	DI^U	REF	Reference frequency input
13	− DI^U	n/c SYNC	FS7140 = No connection FS7145 = Synchronization input
14	P	VDD	Power supply (+3.3 V nominal)
15	DO	CLKP	Clock output
16	DO	CLKN	Inverted clock output

*Key: AI: Analog Input; AO = Analog Output; DI = Digital Input; DI^U = Input with Internal Pull−up; DI_D = Input with Internal Pull−down; DIO = Digital Input/Output; DI−3 = Three−Level Digital Input; DO = Digital Output; P = Power/Ground; # = Active Low Pin

ELECTRICAL SPECIFICATIONS

Table 2. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Typ	Max	Units
V_{DD}	Supply voltage, dc (V_{SS} = ground)	V_{SS} − 0.5		4.5	V
V_1	Input voltage, dc	V_{SS} − 0.5		V_{DD} + 0.5	V
V_O	Output voltage, dc	V_{SS} − 0.5		V_{DD} + 0.5	V
I_{IK}	Input clamp current, dc (V_I < 0 or V_I > V_{DD})	−50		50	mA
I_{OK}	Output clamp current, dc (V_I < 0 or V_I > V_{DD})	−50		50	mA
T_S	Storage temperature range (non−condensing)	−65		150	°C
T_A	Ambient temperature range, under bias	−55		125	°C
T_J	Junction temperature			150	°C
	Re−flow solder profile	Per IPC/JEDEC J−STD−020B			
	Input static discharge voltage protection (MIL−STD 883E, Method 3015.7)			2	kV

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

WARNING: ELECTROSTATIC SENSITIVE DEVICE
Permanent damage resulting in a loss of functionality or performance may occur if this device is subjected to a high-energy electrostatic discharge.

Table 3. OPERATING CONDITIONS

Symbol	Parameter	Min	Typ	Max	Units
V_{DD}	Supply voltage	3.0	3.3	3.6	V
T_A	Ambient operating temperature range	0		70	°C

Table 4. DC ELECTRICAL SPECIFICATIONS (Note 1)

Parameter	Symbol	Conditions/Description	Min	Typ	Max	Units
OVERALL						
Supply current, dynamic	I_{DD}	CMOS mode; F_{XTAL} = 15 MHz; F_{VCO} = 400 MHz; F_{CLK} = 200 MHz; does not include load current		35		mA
Supply current, static	I_{DDL}	SHUT1, SHUT2 bit both “1”		400	700	μA
SERIAL COMMUNICATION I/O (SDA, SCL)						
High−level input voltage	V_{IH}		0.8*V_{DD}			V
Low−level input voltage	V_{IL}				0.2*V_{DD}	V
Hysteresis voltage	V_{hys}			0.33*V_{DD}		V
Input leakage current	I_I	SDA, SCL in read condition	−10		+10	μA
Low−level output sink current (SDA)	I_{OL}	SDA in acknowledge condition; V_{SDA} = 0.4 V	5	14		mA
ADDRESS SELECT INPUT (ADDR0, ADDR1)						
High−level input voltage	V_{IH}		V_{DD}−1.0			V
Low−level input voltage	V_{IL}				0.8	V
High−level input current (pull−down)	I_{IH}	V_{ADDRx} = V_{DD}		30		μA
Low−level input current	I_{IL}	V_{ADDRx} = 0 V	−1		1	μA
REFERENCE FREQUENCY INPUT (REF)						
High−level input voltage	V_{IH}		V_{DD}−1.0			V
Low−level input voltage	V_{IL}				0.8	V
High−level input current	I_{IH}	V_{REF} = V_{DD}	−1		1	μA
Low−level input current (pull−down)	I_{IL}	V_{REF} = 0 V		−30		μA
SYNC CONTROL INPUT (SYNC)						
High−level input voltage	V_{IH}		V_{DD}−1.0			V
Low−level input voltage	V_{IL}				0.8	V
High−level input current	I_{IH}	V_{REF} = V_{DD}	−1		1	μA
Low−level input current (pull−down)	I_{IL}	V_{REF} = 0 V		−30		μA
CRYSTAL OSCILLATOR INPUT (XIN)						
Threshold bias voltage	V_{TH}			V_{DD}/2		V
High−level input current	I_{IH}	V_{XIN} = V_{DD}		40		μA
Low−level input current	I_{IL}	V_{XIN} = GND		−40		μA
Crystal frequency	F_X	Fundamental mode			35	MHz
Recommended crystal load capacitance*	$C_{L(XTAL)}$	For best matching with internal crystal oscillator load		16−18		pF
CRYSTAL OSCILLATOR OUTPUT (XOUT)						
High−level output source current	I_{OH}	V_{XOUT} = 0		−8.5		mA
Low−level output sink current	I_{OL}	V_{XOUT} = V_{DD}		11		mA
PECL CURRENT PROGRAM I/O (IPRG)						
Low−level input current	I_{IL}	V_{IPRG} = 0 V; PECL mode	−10		10	μA
CLOCK OUTPUTS, CMOS MODE (CLKN, CLKP)						
High−level output source current	I_{OH}	V_O = 2.0 V		19		mA

1. Unless otherwise stated, V_{DD} = 3.3 V ± 10%, no load on any output, and ambient temperature range T_A = 0°C to 70°C. Parameters denoted with an asterisk (*) represent nominal characterization data and are not production tested to any specific limits. MIN and MAX characterization data are ± 3σ from typical. Negative currents indicate flows out of the device.

Table 4. DC ELECTRICAL SPECIFICATIONS (Note 1)

Parameter	Symbol	Conditions/Description	Min	Typ	Max	Units
CLOCK OUTPUTS, CMOS MODE (CLKN, CLKP)						
Low−level output sink current	I_{OL}	V_O = 0.4 V		−35		mA
CLOCK OUTPUTS, PECL MODE (CLKN, CLKP)						
IPRG bias voltage	V_{IPRG}	V_{IPRG} will be clamped to this level when a resistor is connected from VDD to IPRG		V_{DD}/3		V
IPRG bias current	I_{IPRG}	$I_{IPRG} - (V_{VDD} - V_{IPRG}) / R_{SET}$			3.5	mA
Sink current to IPRG current ratio				13		
Tristate output current	I_Z		−10		10	μA

1. Unless otherwise stated, V_{DD} = 3.3 V ± 10%, no load on any output, and ambient temperature range T_A = 0°C to 70°C. Parameters denoted with an asterisk (*) represent nominal characterization data and are not production tested to any specific limits. MIN and MAX characterization data are ± 3σ from typical. Negative currents indicate flows out of the device.

Table 5. AC TIMING SPECIFICATIONS (Note 2)

Parameter	Symbol	Conditions/Description	Min	Typ	Max	Units
OVERALL						
Output frequency*	$f_{o(max)}$	CMOS outputs	0		150	MHz
		PECL outputs	0		300	
VCO frequency*	f_{VCO}		40		400	MHz
CMOS mode rise time*	t_r	C_L = 7 pF		1		ns
CMOS mode fall time*	t_f	C_L = 7 pF		1		ns
PECL mode rise time*	t_r	C_L = 7 pF; R_L = 65 ohm		1		ns

REFERENCE FREQUENCY INPUT (REF)						
Input frequency	F_{REF}				80	MHz
Reference high time	t_{REHF}		3			ns
Reference low time	t_{REFL}		3			ns
SYNC CONTROL INPUT (SYNC)						
Sync high time	t_{SYNCH}	For orderly CLK stop/start	3			T_{CLK}
Sync low time	t_{SYNCL}	For orderly CLK stop/start	3			
CLOCK OUTPUT (CLKN, CLKP)						
Duty cycle (CMOS mode)*		Measured at 1.4 V		50		%
Duty cycle (PECL mode)*		Measured at zero crossings of ($V_{CLKP} - V_{CLKN}$)		50		%
Jitter, long term ($\sigma_y(\tau)$)*	$t_{j(LT)}$	For valid programming solutions. Long-term (or cumulative) jitter specified is RMS position error of any edge compared with an ideal clock generated from the same reference frequency. It is measured with a time interval analyzer using a 500 microsecond window, using statistics gathered over 1000 samples.				ps
		FREF/NREF > 1000 kHz		25		ps
		FREF/NREF ≅ 500 kHz		50		ps
		FREF/NREF ≅ 250 kHz		100		ps
		FREF/NREF ≅ 125 kHz		190		ps
		FREF/NREF ≅ 62.5 kHz		240		ps
		FREF/NREF ≅ 31.5 kHz		300		ps
Jitter, period (peak−peak)*	$t_{j(\Delta P)}$	40 MHz < VCO frequency < 100 MHz		75		ps
		VCO frequency > 100 MHz		50		ps

2. Unless otherwise stated, V_{DD} = 3.3 V ± 10%, no load on any output, and ambient temperature range T_A = 0°C to 70°C. Parameters denoted with an asterisk (*) represent nominal characterization data and are not production tested to any specific limits. MIN and MAX characterization data are ± 3σ from typical.

Table 6. SERIAL INTERFACE TIMING SPECIFICATIONS (Note 3)

Parameter	Symbol	Conditions/Description	Fast Mode		Units
			Min	Max	
Clock frequency	f_{SCL}	SCL	0	400	kHz
Bus free time between STOP and START	t_{BUF}		1300		ns
Set−up time, START (repeated)	$T_{su:STA}$		600		ns
Hold time, START	$t_{hd:STA}$		600		ns
Set−up time, data input	$T_{su:DAT}$	SDA	100		ns
Hold time, data input	$t_{hd:DAT}$	SDA	0		ns
Output data valid from clock	t_{AA}			900	ns
Rise time, data and clock	t_R	SDA, SCL		300	ns
Fall time, data and clock	t_F	SDA, SCL		300	ns
High time, clock	t_{HI}	SCL	600		ns
Low time, clock	t_{LO}	SCL	1300		ns
Set−up time, STOP	$t_{su:STO}$		600		ns

3. Unless otherwise stated, V_{DD} = 3.3 V ± 10%, no load on any output, and ambient temperature range T_A = 0°C to 70°C. Parameters denoted with an asterisk (*) represent nominal characterization data and are not production tested to any specific limits. MIN and MAX characterization data are ± 3σ from typical.

FUNCTIONAL BLOCK DIAGRAM

Phase Locked Loop (PLL)

The PLL is a standard phase− and frequency−locked loop architecture. The PLL consists of a reference divider, a phase−frequency detector (PFD), a charge pump, an internal loop filter, a voltage−controlled oscillator (VCO), a feedback divider, and a post divider.

The reference frequency (generated by either the on−board crystal oscillator or an external frequency source), is first reduced by the reference divider. The integer value that the frequency is divided by is called the modulus and is denoted as NR for the reference divider. This divided reference is then fed into the PFD.

The VCO frequency is fed back to the PFD through the feedback divider (the modulus is denoted by NF).

The PFD will drive the VCO up or down in frequency until the divided reference frequency and the divided VCO frequency appearing at the inputs of the PFD are equal. The input/output relationship between the reference frequency and the VCO frequency is then:

$$\frac{f_{VCO}}{N_F} = \frac{f_{REF}}{N_R}$$

This basic PLL equation can be rewritten as

$$f_{VCO} = f_{REF}\left(\frac{N_F}{N_R}\right)$$

A post divider (actually a series combination of three post dividers) follows the PLL and the final equation for device output frequency is:

$$f_{CLK} = f_{REF}\left(\frac{N_F}{N_R}\right)\left(\frac{1}{N_{Px}}\right)$$

Reference Divider

The reference divider is designed for low phase jitter. The divider accepts the output of either the crystal oscillator circuit or an external reference frequency. The reference divider is a 12 bit divider, and can be programmed for any modulus from 1 to 4095 (divide by 1 not available on date codes prior to 0108).

Feedback Divider

The feedback divider is based on a dual−modulus divider (also called dual−modulus prescaler) technique. It permits division by any integer value between 12 and 16383. Simply program the FBKDIV register with the binary equivalent of the desired modulus. Selected moduli below 12 are also permitted. Moduli of: 4, 5, 8, 9, and 10 are also allowed (4 and 5 are not available on date codes prior to 0108).

Post Divider

The post divider consists of three individually programmable dividers, as shown in Figure 2.

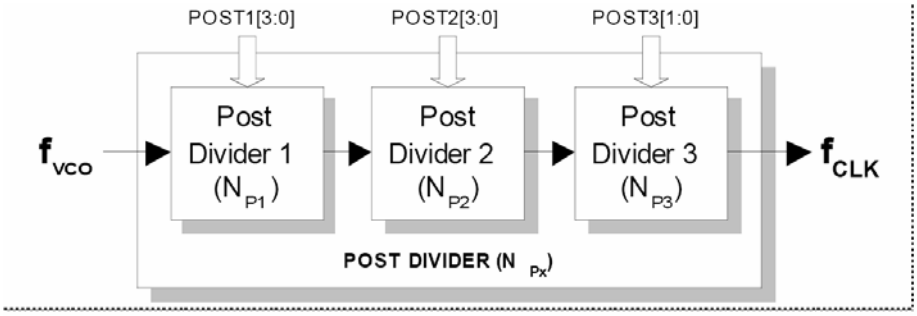

Figure 2. Post Divider

The moduli of the individual dividers are denoted as N_{P1}, N_{P2} and N_{P3}, and together they make up the array modulus N_{PX}.

$N_{PX} = N_{P1} \times N_{P2} \times N_{P3}$

The post divider performs several useful functions. First, it allows the VCO to be operated in a narrower range of speeds compared to the variety of output clock speeds that the device is required to generate. Second, the extra integer in the denominator permits more flexibility in the programming of the loop for many applications where frequencies must be achieved exactly.

Note that a nominal 50/50 duty factor is always preserved (even for selections which have an odd modulus).

See Table 12 for additional information.

Crystal Oscillator

The FS7140 is equipped with a Pierce−type crystal oscillator. The crystal is operated in parallel resonant mode. Internal load capacitance is provided for the crystal. While a recommended load capacitance for the crystal is specified, crystals for other standard load capacitances may be used if great precision of the reference frequency (100 ppm or less) is not required.

Reference Divider Source MUX

The source of frequency for the reference divider can be chosen to be the device crystal oscillator or the REF pin by the REFDSRC bit.

When not using the crystal oscillator, it is preferred to connect XIN to VSS. Do not connect to XOUT.

When not using the REF input, it is preferred to leave it floating or connected to V_{DD}.

Feedback Divider Source MUX

The source of frequency for the feedback divider may be selected to be either the output of the post divider or the output of the VCO by the FBKDSRC bit.

Ordinarily, for frequency synthesis, the output of the VCO is used. Use the output of the post divider only where a deterministic phase relationship between the output clock and reference clock are desired (line−locked mode, for example).

Device Shutdown

Two bits are provided to effect shutdown of the device if desired, when it is not active. SHUT1 disables most externally observable device functions. SHUT2 reduces device quiescent current to absolute minimum values. Normally, both bits should be set or cleared together.

Serial communications capability is not disabled by either SHUT1 or SHUT2.

Differential Output Stage

The differential output stage supports both CMOS and pseudo−ECL (PECL) signals. The desired output interface is chosen via the programming registers.

If a PECL interface is used, the transmission line is usually terminated using a Thévenin termination. The output stage can only sink current in the PECL mode, and the amount of sink current is set by a programming resistor on the LOCK/IPRG pin. The ratio of output sink current to IPRG current is 13:1. Source current for the CLKx pins is provided by the pull−up resistors that are part of the Thévenin termination.

Example

Assume that it is desired to connect a PECL−type fanout buffer right next to the FS7140.

Further assume:

- V_{DD} = 3.3 V
- Desired V_{HI} = 2.4 V
- Desired V_{LO} = 1.6 V
- Equivalent R_{LOAD} = 75 ohms

Then:

R1 (from CLKP and CLKN output to VDD) =
$R_{LOAD} * V_{DD} / V_{HI}$ =
75 * 3.3 / 2.4 =
103 ohms

R2 (from CLKP and CLKN output to GND) =
$R_{LOAD} * V_{DD} / (V_{DD} - V_{HI})$ =
75 * 3.3 / (3.3 − 2.4) =
275 ohms

Rprgm (from VDD to IPRG pin) =
$26 * (V_{DD} * R_{LOAD}) / (V_{HI} - V_{LO}) / 3$ =
26 * (3.3 * 75) / (2.4 − 1.6) / 3 =
2.68 Kohms

SYNC Circuitry

The FS7145 supports nearly instantaneous adjustment of the output CLK phase by the SYNC input. Either edge direction of SYNC (positive−going or negative−going) is supported.

Example (positive−going SYNC selected): Upon the negative edge of SYNC input, a sequence begins to stop the CLK output. Upon the positive edge, CLK resumes operation, synchronized to the phase of the SYNC input (plus a deterministic delay). This is performed by control of the device post−divider. Phase resolution equal to 1/2 of the VCO period can be achieved (approximately down to 2 ns).

I²C−bus Control Interface

This device is a read/write slave device meeting all Philips I²C−bus specifications except a ”general call.” The bus has to be controlled by a master device that generates the serial clock SCL, controls bus access and generates the START and STOP conditions while the device works as a slave. Both master and slave can operate as a transmitter or receiver, but the master device determines which mode is activated. A device that sends data onto the bus is defined as the transmitter, and a device receiving data as the receiver.

I²C−bus logic levels noted herein are based on a percentage of the power supply (V_{DD}). A logic−one corresponds to a nominal voltage of V_{DD}, while a logic−zero corresponds to ground (V_{SS}).

Bus Conditions

Data transfer on the bus can only be initiated when the bus is not busy. During the data transfer, the data line (SDA) must remain stable whenever the clock line (SCL) is high. Changes in the data line while the clock line is high will be interpreted by the device as a START or STOP condition. The following bus conditions are defined by the I²C−bus protocol.

Not Busy

Both the data (SDA) and clock (SCL) lines remain high to indicate the bus is not busy.

START Data Transfer

A high to low transition of the SDA line while the SCL input is high indicates a START condition. All commands to the device must be preceded by a START condition.

STOP Data Transfer

A low to high transition of the SDA line while SCL input is high indicates a STOP condition. All commands to the device must be followed by a STOP condition.

Data Valid

The state of the SDA line represents valid data if the SDA line is stable for the duration of the high period of the SCL line after a START condition occurs. The data on the SDA line must be changed only during the low period of the SCL signal. There is one clock pulse per data bit.

Each data transfer is initiated by a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions is determined by the master device, and can continue indefinitely. However, data that is overwritten to the device after the first eight bytes will overflow into the first register, then the second, and so on, in a first−in, first−overwritten fashion.

Acknowledge

When addressed, the receiving device is required to generate an acknowledge after each byte is received. The master device must generate an extra clock pulse to coincide with the acknowledge bit. The acknowledging device must pull the SDA line low during the high period of the master acknowledge clock pulse. Setup and hold times must be taken into account.

The master must signal an end of data to the slave by not generating and acknowledge bit on the last byte that has been read (clocked) out of the slave. In this case, the slave must leave the SDA line high to enable the master to generate a STOP condition.

I²C−bus Operation

All programmable registers can be accessed randomly or sequentially via this bi−directional two wire digital interface. The crystal oscillator does not have to run for communication to occur.

The device accepts the following I²C−bus commands:

Slave Address

After generating a START condition, the bus master broadcasts a seven−bit slave address followed by a R/W bit. The address of the device is:

A6	A5	A4	A3	A2	A1	A0
1	0	1	1	0	X	X

where X is controlled by the logic level at the ADDR pins. The selectable ADDR bits allow four different FS7140 devices to exist on the same bus. Note that every device on an I²C−bus must have a unique address to avoid possible bus conflicts.

Random Register Write Procedure

Random write operations allow the master to directly write to any register. To initiate a write procedure, the R/W bit that is transmitted after the seven−bit device address is a logic−low. This indicates to the addressed slave device that a register address will follow after the slave device acknowledges its device address. The register address is written into the slave’s address pointer. Following an acknowledge by the slave, the master is allowed to write eight bits of data into the addressed register. A final acknowledge is returned by the device, and the master generates a STOP condition.

If either a STOP or a repeated START condition occurs during a register write, the data that has been transferred is ignored.

Random Register Read Procedure

Random read operations allow the master to directly read from any register. To perform a read procedure, the R/W bit that is transmitted after the seven−bit address is a logic−low, as in the register write procedure. This indicates to the addressed slave device that a register address will follow after the slave device acknowledges its device address. The register address is then written into the slave's address pointer.

Following an acknowledge by the slave, the master generates a repeated START condition. The repeated START terminates the write procedure, but not until after the slave's address pointer is set. The slave address is then resent, with the R/W bit set this time to a logic−high, indicating to the slave that data will be read. The slave will acknowledge the device address, and then transmits the eight−bit word. The master does not acknowledge the transfer but does generate a STOP condition.

Sequential Register Write Procedure

Sequential write operations allow the master to write to each register in order. The register pointer is automatically incremented after each write. This procedure is more efficient than the random register write if several registers must be written.

To initiate a write procedure, the R/W bit that is transmitted after the seven−bit device address is a logic−low. This indicates to the addressed slave device that a register address will follow after the slave device acknowledges its device address. The register address is written into the slave's address pointer. Following an acknowledge by the slave, the master is allowed to write up to eight bytes of data into the addressed register before the register address pointer overflows back to the beginning address.

An acknowledge by the device between each byte of data must occur before the next data byte is sent.

Registers are updated every time the device sends an acknowledge to the host. The register update does not wait for the STOP condition to occur. Registers are therefore updated at different times during a sequential register write.

Sequential Register Read Procedure

Sequential read operations allow the master to read from each register in order. The register pointer is automatically incremented by one after each read. This procedure is more efficient than the random register read if several registers must be read.

To perform a read procedure, the R/W bit that is transmitted after the seven−bit address is a logic−low, as in the register write procedure. This indicates to the addressed slave device that a register address will follow after the slave device acknowledges its device address. The register address is then written into the slave's address pointer.

Following an acknowledge by the slave, the master generates a repeated START condition. The repeated START terminates the write procedure, but not until after the slave's address pointer is set. The slave address is then resent, with the R/W bit set this time to a logic−high, indicating to the slave that data will be read. The slave will acknowledge the device address, and then transmits all eight bytes of data starting with the initial addressed register. The register address pointer will overflow if the initial register address is larger than zero. After the last byte of data, the master does not acknowledge the transfer but does generate a STOP condition.

Table 9. DEVICE CONFIGURATION BITS

Name	Description
REFDSRC	Reference divider source
	[0] = crystal oscillator / [1] = REF pin
FBKDSRC	Feedback divider source
	[0] = VCO output / [1] = post divider output
SHUT1	Shutdown1
	[0] = normal / [1] = powered down
SHUT2	Shutdown2
	[0] = normal / [1] = powered down
CMOS	CLKP/CLKN output mode
	[0] = PECL output / [1] CMOS output

Table 10. MAIN LOOP TUNING BITS

Name	Description	
CP[1:0]	Charge pump current	
	[00]	2.0 μA
	[01]	4.5 μA
	[10]	11.0 μA
	[11]	22.5 μA
LR[1:0]	Loop filter resistor select	
	[00]	400 KΩ
	[01]	133 KΩ
	[10]	30 KΩ
	[11]	12 KΩ
LC	Loop filter capacitor select	
	[0]	185 pF
	[1]	500 pF

Table 11. PLL DIVIDER CONTROL BITS

Name	Description
REFDIV[11:0]	Reference divider (N_R)
FBKDIV[13:0]	Feedback divider (N_R)

Table 12. SYNC CONTROL BITS (FS7145 only)

Name	Description
SYNCEN	Sync enable
	[0] = disabled / [1] = enabled
SYNCPOL	Sync polarity
	[0] = negative edge / [1] = positive edge

Table 13. POST DIVIDER CONTROL BITS

Name	Description	
POST1[3:0]	Post divider #1 (N_{P1}) modulus	
	[0000]	1
	[0001]	2
	[0010]	3
	[0011]	4
	[0100]	5
	[0101]	6
	[0110]	7
	[0111]	8
	[1000]	9
	[1001]	10
	[1010]	11
	[1011]	12
	[1100]	Do not use
	[1101]	
	[1110]	
	[1111]	
POST2[3:0]	Post divider #2 (N_{P2}) modulus	
	[0000]	1
	[0001]	2
	[0010]	3
	[0011]	4
	[0100]	5
	[0101]	6
	[0110]	7

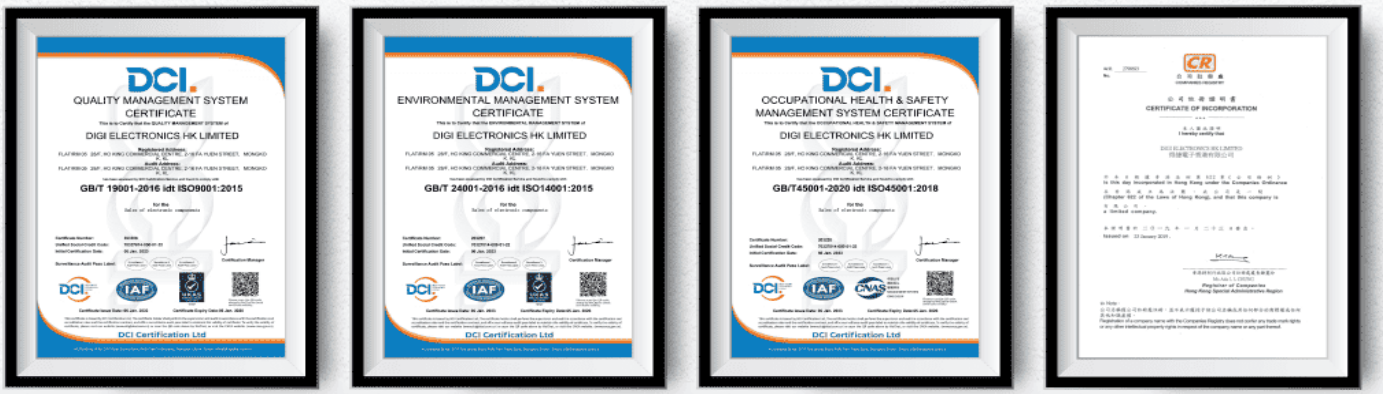
OUR CERTIFICATE

DiGi provide top-quality products and perfect service for customer worldwide through standardization, technological innovation and continuous improvement. DiGi through third-party certification, we striciy control the quality of products and services. Welcome your RFQ to Email: Info@DiGi-Electronics.com



Tel: +00 852-30501935

RFQ Email: Info@DiGi-Electronics.com

DiGi is a global authorized distributor of electronic components.
