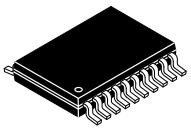
2.5V / 3.3V 1:5 Differential ECL/PECL/HSTL Clock Driver

MC100LVEP14



TSSOP−20
DT SUFFIX
CASE 948E

Description

The MC100LVEP14 is a low skew 1−to−5 differential driver, designed with clock distribution in mind, accepting two clock sources into an input multiplexer. The ECL/PECL input signals can be either differential or single−ended (if the V_{BB} output is used). HSTL inputs can be used when the LVEP14 is operating under PECL conditions.

The LVEP14 specifically guarantees low output−to−output skew. Optimal design, layout, and processing minimize skew within a device and from device to device.

To ensure that the tight skew specification is realized, both sides of any differential output need to be terminated identically into 50 Ω even if only one output is being used. If an output pair is unused, both outputs may be left open (unterminated) without affecting skew.

The common enable ($\overline{EN}$) is synchronous, outputs are enabled/disabled in the LOW state. This avoids a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock; therefore, all associated specification limits are referenced to the negative edge of the clock input.

The MC100LVEP14, as with most other ECL devices, can be operated from a positive V_{CC} supply in PECL mode. This allows the LVEP14 to be used for high performance clock distribution in +3.3 V or +2.5 V systems. Single−ended CLK input pin operation is limited to a $V_{CC} \geq 3.0$ V in PECL mode, or $V_{EE} \leq -3.0$ V in NECL mode. Designers can take advantage of the LVEP14's performance to distribute low skew clocks across the backplane or the board.

Features

- 100 ps Device−to−Device Skew
- 25 ps Within Device Skew
- 400 ps Typical Propagation Delay
- Maximum Frequency > 2 GHz Typical
- The 100 Series Contains Temperature Compensation
- PECL and HSTL Mode:
  V_{CC} = 2.375 V to 3.8 V with V_{EE} = 0 V
- NECL Mode:
  V_{CC} = 0 V with V_{EE} = −2.375 V to −3.8 V
- LVDS Input Compatible
- Open Input Default State
- These Devices are Pb−Free and are RoHS Compliant

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

2. Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary +0.125 V to −1.3 V.
3. All loading with 50 Ω to V_{CC} − 2.0 V.
4. Do not use V_{BB} at V_{CC} < 3.0 V.
5. V_{IHCMR} min varies 1:1 with V_{EE}, V_{IHCMR} max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal.
