NB100LVEP221

2.5V/3.3V 2:1:20 Differential HSTL/ECL/PECL Clock Driver

Description

The NB100LVEP221 is a low skew 2:1:20 differential clock driver, designed with clock distribution in mind, accepting two clock sources into an input multiplexer. The two clock inputs are differential ECL/PECL; CLK1/ $\overline{\text{CLK1}}$ can also receive HSTL signal levels. The LVPECL input signals can be either differential configuration or single-ended (if the V_{BB} output is used).

The LVEP221 specifically guarantees low output-to-output skew. Optimal design, layout, and processing minimize skew within a device and from device to device.

To ensure tightest skew, both sides of differential outputs should be terminated identically into 50 Ω even if only one output is being used. If an output pair is unused, both outputs may be left open (unterminated) without affecting skew.

The NB100LVEP221, as with most other ECL devices, can be operated from a positive V_{CC} supply in LVPECL mode. This allows the LVEP221 to be used for high performance clock distribution in +3.3 V or +2.5 V systems. In a PECL environment, series or Thevenin line terminations are typically used as they require no additional power supplies. For more information on PECL terminations, designers should refer to Application Note AND8020/D.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended LVPECL input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Single-ended CLK input operation is limited to a $V_{\text{CC}} \geq 3.0$ V in LVPECL mode, or $V_{\text{EE}} \leq -3.0$ V in NECL mode.
