Description

The [LM193](#), [LM293](#), [LM393](#) and [LM393W](#) devices consist of two independent low voltage comparators designed specifically to operate from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

These comparators also have a unique characteristic in that the input common-mode voltage range includes ground even though operated from a single power supply voltage.

The [LM393W](#) offers additional ESD robustness of 2 kV HBM on all pins.

- At output switch point, $V_o = 1.4\text{ V}$, $R_s = 0$ with V_{CC}^+ from 5 V to 30 V , and over the full common-mode range (0 V to $(V_{CC}^+) - 1.5\text{ V}$).
- The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so no loading charge exists on the reference of input lines.
- Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3 V (or 0.3 V below the negative power supply, if used).
- The response time specified is for a 100 mV input step with 5 mV overdrive. For larger overdrive signals, 300 ns can be obtained.
