DiGi Electronics Part Number	THCV242A-P-B-DG
Manufacturer	Thine Solutions, Inc.
Manufacturer Product Number	THCV242A-P-B
Description	IC 2-LANE V-BY-ONE HS TO MIPI C
Detailed Description	4Gbps Deserializer 2 Input 6 Output 64-QFN (9x9)

Tel: +00 852-30501935

RFQ Email: Info@DiGi-Electronics.com

DiGi is a global authorized distributor of electronic components.

Purchase and inquiry

Manufacturer Product Number:

THCV242A-P-B

Series:

THine® V-by-One®

Function:

Deserializer

Input Type:

V-by-One®HS

Number of Inputs:

2

Voltage - Supply:

1.1V ~ 1.3V, 1.7V ~ 2V, 2V ~ 3V, 3V ~ 3.6V

Grade:

-

Mounting Type:

Surface Mount

Supplier Device Package:

64-QFN (9x9)

Manufacturer:

THine Solutions, Inc.

Product Status:

Active

Data Rate:

4Gbps

Output Type:

CSI-2, MIPI

Number of Outputs:

6

Operating Temperature:

-40°C ~ 105°C (TA)

Qualification:

-

Package / Case:

64-VFQFN Exposed Pad

Environmental & Export classification

RoHS Status:

ROHS3 Compliant

REACH Status:

REACH Unaffected

HTSUS:

8542.39.0001

Moisture Sensitivity Level (MSL):

3 (168 Hours)

ECCN:

EAR99

THCV242A-P

SerDes receiver with bi-directional transceiver

1. General Description

THCV242A-P is designed to support 8Mpixel/4K 60fps RAW10 uncompressed video data over long length 100ohm differential STP or single-end 50ohm Coaxial cable with several in-line connectors between camera and processor by V-by-One® HS.

THCV242A-P supports a MIPI CSI-2. Each CSI-2 data lane can transmit up to 1.5Gbps/lane with single clock pair (1st port) output or up to 1.2Gbps/lane with dual clock outputs.

One high-speed V-by-One® HS lane can transmit up to 1080p60fps. The maximum serial data rate is 4Gbps/lane. 2nd input lane supports HDR large amount of data or camera switch experience.

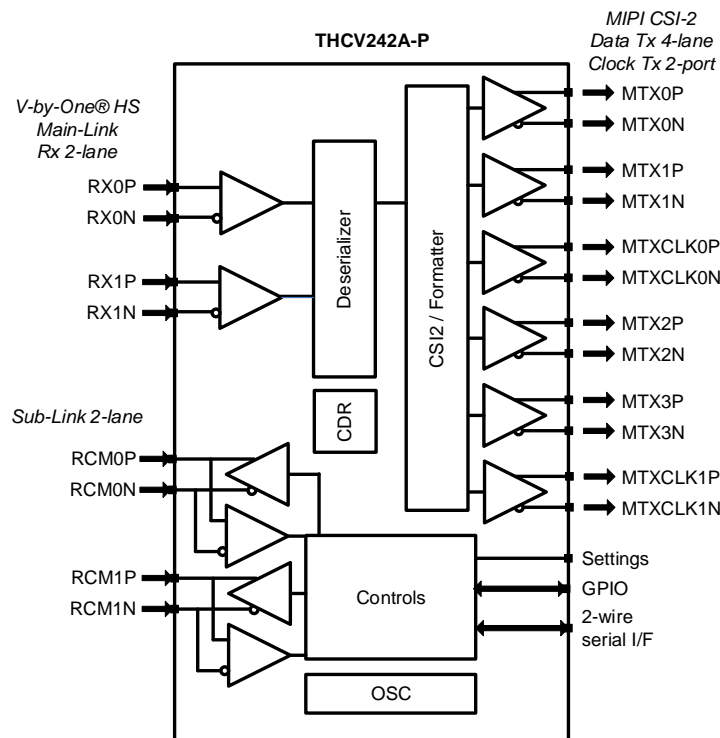

THCV242A-P is capable to control and monitor remote camera module from MPU via GPIO or 1Mbps 2-wire serial interface.

Several fault and error detection function including CRC provides hardware functional safety design.

2. Features

- MIPI CSI-2 with 1,2 or 4-lane output
- MIPI D-PHY supports 80Mbps~1.5Gbps
- Video formats: RAW8/10/12/14/16/20, YUV422/420, RGB888/666/565, JPEG, User-defined generic 8-bit
- V-by-One® HS 400Mbps~4Gbps x2lane
- V-by-One® HS standard version1.5
- Video stream switch and copy/distribution
- Frame sync remote supply scheme for multiple camera stream synchronization
- Wide range IO voltage from 1.7V to 3.6V
- 2-wire serial interface 1Mbps bridge function
- Remote GPIO/UART control and monitoring
- Error detection including CRC and notification
- QFN64 9x9mm 0.5mm pitch Exp-pad package

5. Pin Description

Pin Name	Pin #	type*	Description
RX0P/N	54, 53	CI	V-by-One® HS Input lane0
RX1P/N	57, 56	CI	V-by-One® HS Input lane1
RCM0P/N	4, 3	CB	CML Bi-directional Input/Output (Sub-Link).
RCM1P/N	6, 5	CB	CML Bi-directional Input/Output (Sub-Link).
MTX0P/N	22, 21	MO	MIPI differential data outputs lane0
MTX1P/N	26, 25	MO	MIPI differential data outputs lane1
MTX2P/N	20, 19	MO	MIPI differential data outputs lane2
MTX3P/N	28, 27	MO	MIPI differential data outputs lane3
MTXCLK0P/N	24, 23	MO	MIPI differential clock outputs lane0
MTXCLK1P/N	18, 17	MO	MIPI differential clock outputs lane1
RSVDT1L2	13	I	Reserved pin, Must be tied to Ground for normal operation.
RSVDT2H2	12	I	Reserved pin. Must be tied to VDDIO2 for normal operation.
PDN	31	IL	Power Down (User Power On Reset control must be required.) 0: Power Down Mode 1: Normal Operation
AIN1	37	IL	Device Address Setting for 2-wire Serial Interface [AIN1:AIN0]=00: ID=7'h0B [AIN1:AIN0]=01: ID=7'h34
AIN0	36	IL	[AIN1:AIN0]=10: ID=7'h77 [AIN1:AIN0]=11: ID=7'h65
SCL	34	B	2-wire Serial Interface clock line
SDA	35	B	2-wire Serial Interface data line
GPIO0	40	B	General Purpose Input/Output
GPIO1	41	B	General Purpose Input/Output
GPIO2	42	B	General Purpose Input/Output
GPIO3	43	B	General Purpose Input/Output
GPIO4	44	B	General Purpose Input/Output
GPIO5	45	B	General Purpose Input/Output
GPIO6	46	B	General Purpose Input/Output
GPIO7	47	B	General Purpose Input/Output
INT0	38	O	Interrupt signal output. It must be connected with a pull-up resistor.
INT1	39	O	0 : Interrupt occurred 1 : Steady state
ERR0	49	O	Internal Error / status signal monitoring output
ERR1	50	O	Internal Error / status signal monitoring output
EXTSYNC	32	B	External Sync input/output for multiple camera synchronization
RSVDL0	59, 60, 62, 63	I	Reserved Pins, Must be tied to ground for normal operation.
RSVDL2	7, 8, 9, 10, 14	I	Reserved Pins, Must be tied to ground for normal operation.
VDDIO1	33, 48	P	Power Supply for CMOS I/O
VDDIO2	2, 11	P	Power Supply for Sub-Link I/O
VDDCORE	1, 15, 51	P	Power Supply for Digital Circuit
VDDRFX	52, 58, 64	P	Power Supply for Analog Circuit
VSSRX	55, 61	G	GND for Analog Circuit
VDDTX	16, 29	P	Power Supply for Analog Circuit
VDDPLL	30	P	Power Supply for Analog Circuit
EXPGND	65	G	Exposed GND Pad

*type symbol ; MO=MIPI Output, CI=CML Input, CB=CML Bi-directional input/output

IL=Low Speed LVCMOS Input, I=Input, O=LVCMOS Output, B=LVCMOS Bi-directional input/output

P=Power, G=Ground

6. Functional Description

6.1. Functional Overview

THCV242A-P can receive CML video signal transmitted over 15m length and encode it to MIPI CSI-2 format. With High Speed CML SerDes, high reliability and robustness encoding scheme and CDR (Clock and Data Recovery) architecture, the THCV242A-P enables to receive RAW/YUV/RGB/JPEG/Generic8bit data through Main-Link by single 100ohm differential pair or 50ohm Coax cable with minimal external components. In addition, THCV242A-P has Sub-Link which enables bi-directional transmission of 2-wire serial interface signals, GPIO signals and also HTPDN/LOCKN signals for Main-Link through the other 1-pair of CML-Line. The THCV242A-P system is able to watch remote devices and to control them via 2-wire serial interface or GPIOs. They also can report interrupt events caused by change of remote device statuses and internal statuses such as CRC error.

THCV242A-P_Rev.4.10_E

6.2. V-by-One® HS

6.2.1. V-by-One® HS input setting

THCV242A-P has a V-by-One® HS receiver and it can be connected a V-by-One® HS transmitter via transmission line divided by AC-coupled.

Figure 1. V-by-One® HS connection scheme (differential transmission case)

Setting of V-by-One® HS input format can be configurable by 2-wire access to internal register.

Table 1. V-by-One® HS input format setting (all lanes)

Address	bit	Register Name	width	R/W	init	Description
0x1012	[7:5]	reserved	3	-	-	-
	[4]	R_RGB565_ON_L0	1	R/W	1'h0	<this register is valid only when 0x1012[3:0]=0x1> Main-Link Input Data Format Setting2 for all lane 0x0: RGB888 0x1: RGB565

6.2.2. MPRF (Main-Link PRivate Format)

MPRF format encoding preserves original data packet input to V-by-One® HS transmitter and output the data packet from THCV242A-P. The counterpart transmitter must have installed MPRF format decoder like THCV241A-P because MPRF is not standard format.

Input V-by-One® HS Byte Mode is 4Byte Mode.

Video formats: RAW8/10/12/14/16/20, YUV422/420, RGB888/666/565, JPEG, and User-defined generic 8-bit are all supported with MPRF.

Figure 2. MPRF (Main-Link PRivate Format)

6.2.3. V-by-One® HS standard format

THCV242A-P input format capabilities as receiver are shown as follows. D[31:0] indicates V-by-One® HS standard version 1.5 UnPacker packet definition. Data can be transmitted normally only when both transmitter and receiver are set to the same available format. Some of the THCV242A-P format may not be supported by particular counterpart transmitter because THCV242A-P prepares multiple formats that suit to multiple transmitter devices alternatives.

6.2.4. Link Status (HTPDN/LOCKN)

Hot-Plug Function

HTPDN indicates Main-Link connect condition between Transmitter and Receiver. HTPDN of Transmitter side is high when Receiver is not active or not connected. Then Transmitter can enter into power down mode. HTPDN is set to Low by the Receiver when Receiver is active and connects to the Transmitter, and then Transmitter must start up and transmit CDR training pattern for link training. HTPDN is open drain output at the receiver side. Transmitter side needs Pull-up resistor.

There is an application option to omit HTPDN connection between Transmitter and Receiver. In this case, HTPDN at Transmitter side should always be at Low.

Lock Detect Function

LOCKN indicates whether CDR PLL of Main-Link is in lock status or not. LOCKN at Transmitter input is set to High by pull-up resistor when Receiver is not active or in CDR PLL training. LOCKN is set to Low by Receiver when CDR lock is completed. After that the CDR training mode finishes and then Transmitter shifts to the normal mode. LOCKN of Receiver is open drain. Transmitter side needs pull-up resistor.

When an application omits HTPDN, LOCKN signal should only be considered with HTPDN pulled low by Receiver.

Figure 3. Physical wire connection for wired Hot-plug and Lock detect scheme

It will need same GND potential reference between transmitter and receiver device to connect HTPDN and LOCKN pins directly like above. HTPDN and LOCKN can also be transmitted via Sub-Link without physical wire connection. Assignment can be configurable by 2-wire access to internal register.

**Table 8.** HTPDN/LOCKN register

6.3. Local, Remote and Remote Slave Register Programming

6.3.1. 2-wire serial I/F slave Device ID

To use basic functions, initialization, GPIO (General Purpose Input/Output), fault/error detection, and interrupt function, 2-wire serial I/F enables to access registers. AIN<1:0> pin determines 2-wire slave Device ID setting.

Table 9. 2-wire serial I/F Device ID select by AIN pin

Pin Name	Description
AIN1	Device Address Setting for 2-wire Serial Interface [AIN1:AIN0]=00: ID=7'h0B [AIN1:AIN0]=01: ID=7'h34
AIN0	[AIN1:AIN0]=10: ID=7'h77 [AIN1:AIN0]=11: ID=7'h65

As an additional method, 2-wire slave Device ID setting can be changed from default value by register setting.

Table 10. 2-wire serial I/F Device ID select by register setting

Address	bit	Register Name	width	R/W	Init	Description
0x0030	[7:0]	R_2WIRE_SADR	8	RW	8'h00	2-wire slave device address setting [7] 2-wire slave device address control 0x0: 2-wire slave device addr. is set by AIN1 and AIN0 pin 0x1: 2-wire slave device addr. is set by following register [6:0] <this regiseter is valid when 0x0030[1:0]=0x1> [6:0] 2-wire slave device address value for register control

6.3.2. 2-wire serial Read/Write access to local Register

HOST MPU can directly access THCV242A-P local register by 2-wire serial I/F.

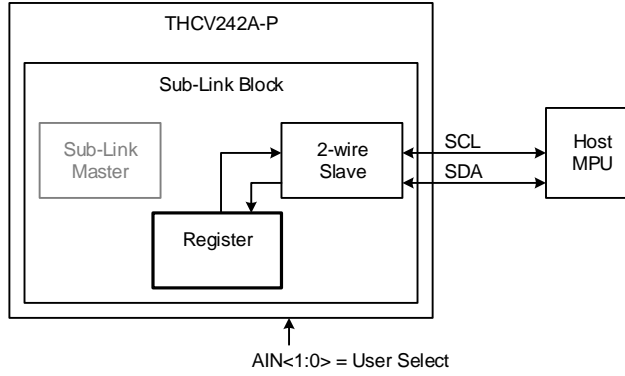

Figure 4. Host to THCV242A-P local register access configuration

THCV242A-P_Rev.4.10_E

6.3.4. Sub-Link setting

THCV242A-P has Sub-Link which enables bi-directional transmission of 2-wire serial interface signals, GPIO signals and also HTPDN/LOCKN signals for Main-Link. THCV242A-P is Sub-Link Master and connectable to Sub-Link Slave device such as THCV241A-P.

Sub-Link Polling interval is controllable from about 20us to 800us, that may have relationships on fault/error detection, interrupt, or other UART / GPIO transfer time designed on application. SSR (Sub-Link Status Read) interval determines recovery quickness from 2-wire serial remote communication completion.

Table 12. Sub-Link Master protocol basic setting

To use GPIO (General Purpose Input/Output) pin, fault/error detection and interrupt function, “2-wire Set & Trigger mode1”, “2-wire Pass Through mode1” enables remote register access. THCV242A-P, Sub-Link Master device has 2-wire serial slave block and can connect to HOST MPU. On the other hand, the counterpart Sub-Link Slave device has 2-wire serial master block and can connect to remote side 2-wire serial slave devices.

HOST MPU can access register of Sub-Link Master device, Sub-Link Slave device and remote side 2-wire serial slave devices.

6.3.5. Sub-Link 2-wire Read/Write access to remote Register

6.3.5.1. Sub-Link 2-wire Set and Trigger mode

HOST MPU can access to Sub-Link Slave’s register via THCV242A-P as Sub-Link Master only by THCV242A-P internal local register control and monitoring on 2-wire Set&Trigger mode1.

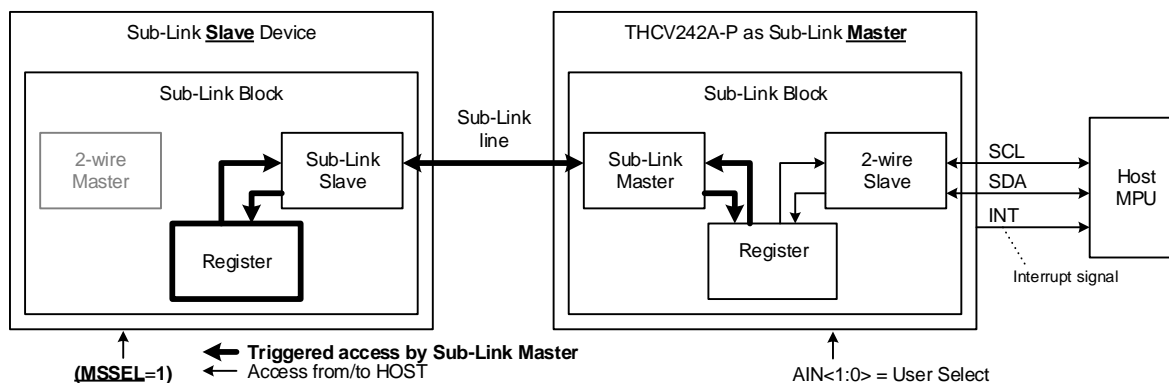

Figure 7. Host MPU to Sub-Link Slave Register via THCV242A-P access configuration

HOST MPU can access to remote side 2-wire serial slave register via THCV242A-P as Sub-Link Master only by THCV242A-P internal local register control and monitoring on 2-wire Set&Trigger mode1.

Figure 8. Host MPU to remote 2-wire slave devices via THCV242A-P access configuration

In principle, when Sub-Link bridges 2-wire serial interface communication from Sub-Link Master to Sub-Link Slave or remote side 2-wire serial slave devices, time lag occurs between HOST MPU side 2-wire serial access and Sub-Link Slave internal bus access or remote side 2-wire serial access.

R_2WIRE_CLKSEN (Sub-Link Master side register, 0x00E2 bit0) selects whether 2-wire serial slave of Sub-Link Master perform clock stretching.

When R_2WIRE_CLKSEN = 1, Sub-Link Master device waits HOST MPU until Sub-Link Slave register access or remote side 2-wire serial slave register access complete by clock stretching.

When R_2WIRE_CLKSEN = 0, Sub-Link Master device informs HOST MPU that Sub-Link Slave register access or remote side 2-wire serial register access has completed by interruption (detectable on INT pin) without clock stretching.

Figure 9. Sub-Link Master 2-wire slave clock stretching operation

6.3.5.2. Sub-Link 2-wire Pass Through mode

Sub-Link Master 2-wire Pass Through mode1 can bridge original local 2-wire commands to remote side. 2-wire Pass Through mode1 uses 2-wire slave clock stretching scheme at local Sub-Link Master side. Host MCU 2-wire master must be no problem with clock stretching wait from 2-wire slave.

Sub-Link Slave side processing protocol “Divided write/read” scheme divides 2-wire commands into determined data Byte groups. Each data Byte groups are sent separately on remote side. Burst write/read access target Sub-Address (Word-Address) is interpreted so that subsequent Sub-Address (Word-Address) from 2nd group is automatically and properly incremented. As shown below, remote side 2-wire accesses are independent each other by determined Byte, which are defined in R_2WIREPT_WA_BYTE and R_2WIREPT_DATA_BYTE at R_2WIREPT1_PASS_MODE[1]=1.

Figure 10. 2-wire Pass Through mode1 Sub-Link Slave command Divided scheme

On address processing protocol “Assigned address & rename”, THCV242A-P 2-wire slave respond only to 2-wire device address defined in R_2WIREPT1_PASS_ADRxy1 (x=Lane0 or Lane1, y=0/1/2/3) for remote Pass Through operation. Otherwise, 2-wire commands are ignored except THCV242A-P itself address. The device address can be renamed before remote send. The counterpart Sub-Link Slave internal register access is available with R_2WIREPT1_PASS_ADRINx (x=Lane0 or Lane1) setting.

On address processing protocol “All Through”, THCV242A-P 2-wire slave respond basically all 2-wire device address for remote Pass Through operation except THCV242A-P itself address. Additionally, Defined addresses in R_2WIREPT2_NOPASS_ADRxz (x=Lane0 or Lane1, z=0/1/2/3/4/5/6/7) can be ignored by THCV242A-P.

6.4.1. Register GPIO

GPIO output control are available with register.

6.4.2. Through GPIO

Local GPIO input is continuously reflected to remote GPIO output via Sub-Link polling. Bridging data are sampled every Sub-Link polling, whose basic interval is controlled by register R_SLINK_POL_TIM_UP/DN. Remote 2-wire access may become long transaction and could lengthen Through GPIO polling reflection interval.

Figure 12. Through GPIO bridge sampling

As default setting with THCV231 as Sub-Link Slave communication (THCV242A-P as Sub-Link Master), GPIO1 Sub-Link Polling bridges input to THCV231’s GPIO4 through mode and GPIO0 Sub-Link Polling bridges input to THCV231’s GPIO3 through mode respectively.

As default setting with THCV241A-P as Sub-Link Slave communication (THCV242A-P as Sub-Link Master), GPIO0/1 are dedicated to GPI to Sub-Link Lane0. GPIO2/3 are dedicated to GPI to Sub-Link Lane1. GPIO2/3 are also dedicated to GPO from selected Sub-Link Lane.

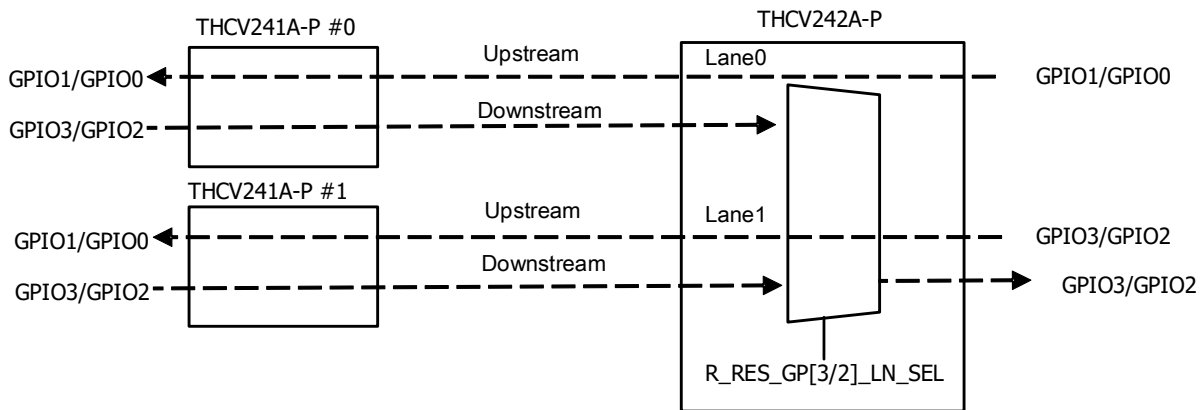

Figure 13. Through GPIO via Sub-Link transaction assignment with THCV241A-P

Remote UART bridge is supported with Sub-Link Through GPIO input/output. Remote UART Tx and Rx bridge baud rate is supposed to be designed against Sub-Link Polling interval to accommodate deterministic jitter caused by intermittent Sub-Link communication timing.

6.4.3. GPIO as secondary 2-wire port

GPIO port can be secondary 2-wire port, which can accommodate dual 2-wire access from two processors.

If two 2-wire commands are inputted at the same time, the earlier command can be communicated and the later command are kept wait by clock stretching scheme.

6.5. MIPI

6.5.1. Deserializer and CSI-2 Formatter

6.5.1.1. PLL setting

PLL setting is required. PLL setting set R_PLL_SETTING[47:0] is related with Main-Link data-rate.

Figure 14. Reference clock supply basic method

PLL_SETTING[47:0] must be selected proper to meet below constraints.

Table 21. PLL constraints

symbol	description	min	typ	max	unit
F(IN)	PLL input pixel clock frequency	10	-	133	MHz
RefDiv	Reference Divider value	1	-	7	-
FBDiv	FeedBack Divider value	20	-	130	-
OutDiv1	1st Output Divider value (OutDiv1 must be >= OutDiv2)	1	-	7	-
OutDiv2	2nd Output Divider value (OutDiv1 must be >= OutDiv2)	1	-	7	-
F(PFD)	PFD frequency	10	-	-	MHz
F(VCO)	VCO frequency	500	-	1500	MHz
F(OUT)	PLL output pixel clock frequency	80	-	1500	MHz

Pixel clock frequency made by PLL is calculated as below.

$$[PCLK.input] = \text{Pixel clock recovered on V-by-One® HS per lane} = [F(\text{Main-Link input})] = F(\text{IN})$$

$$[F(\text{Main-Link input})] = \text{Main-Link data-rate per lane} / (\text{Byte mode} \times 8 \times 10/8)$$

$$\text{MIPI data-rate per lane (Mbps)} = [F(\text{MIPI output})] (\text{MHz})$$

$$= \text{MIPI High Speed mode data-rate per lane}$$

$$F(\text{VCO}) = \frac{[F(\text{Main-Link input})] \times [\text{FBDiv}]}{[\text{RefDiv}]}$$

$$[PCLK.output] = [F(\text{MIPI output})] = \frac{[F(\text{Main-Link input})] \times [\text{FBDiv}]}{[\text{RefDiv}] \times [\text{OutDiv1}] \times [\text{OutDiv2}]} = F(\text{OUT})$$

$$\frac{[F(\text{MIPI output})]}{[F(\text{Main-Link input})]} = \frac{[\text{FBDiv}]}{[\text{RefDiv}] \times [\text{OutDiv1}] \times [\text{OutDiv2}]}$$

$$\text{MIPI High Speed mode DDR output clock per lane} = [F(\text{MIPI output})] / 2 (\text{MHz})$$

Table 22. PLL setting

Address	bit	Register Name	width	R/W	init	Description
0x1021	[7:0]	R_PLL_SETTING[47:40]	8	R/W	8'h00	PLL setting value, Feedback Divider value (integer part)
0x1022	[7:3]	R_PLL_SETTING[39:35]	5	-	5'h00	PLL setting value (Must be set 0x00)
	[2:0]	R_PLL_SETTING[34:32]	3	R/W	3'h0	PLL setting value, Reference Divider value
0x1023	[7]	R_PLL_SETTING[31]	1	-	1'h0	PLL setting value (Must be set 0x0)
	[6:4]	R_PLL_SETTING[30:28]	3	R/W	3'h0	PLL setting value, OutDiv1 (OutDiv1 must be >= OutDiv2)
	[3]	R_PLL_SETTING[27]	1	-	1'h0	PLL setting value (Must be set 0x0)
	[2:0]	R_PLL_SETTING[26:24]	3	R/W	3'h0	PLL setting value, OutDiv2 (OutDiv1 must be >= OutDiv2)
0x1024	[7:0]	R_PLL_SETTING[23:16]	8	R/W	8'h00	PLL setting value, Feedback Divider value (decimal part MSB)
0x1025	[7:0]	R_PLL_SETTING[15:8]	8	R/W	8'h00	PLL setting value, Feedback Divider value (decimal part)
0x1026	[7:0]	R_PLL_SETTING[7:0]	8	R/W	8'h00	PLL setting value, Feedback Divider value (decimal part LSB)

PLL setting must fulfill below frequency ratio rule.

Table 23. PLL frequency ratio rule

Format	[F(MIPI output)] / [F(Main-Link input)] frequency ratio
MPRF	1*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RGB888	3/4*[Main-Link input lane#]*4*8 / [MIPI output lane#]
YUV422 Normal	2/4*[Main-Link input lane#]*4*8 / [MIPI output lane#]
YUV422 Demux	1*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW8 Normal	2/4*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW8 Demux	1*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW10 Normal	10/32*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW10 Demux	20/32*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW12 Normal	12/32*[Main-Link input lane#]*4*8 / [MIPI output lane#]
RAW12 Demux	24/32*[Main-Link input lane#]*4*8 / [MIPI output lane#]

Below Table is Look Up Table example for typical cases.

Table 24. PLL setting Look up table example

MTX0P/N and MTX2P/N can be assigned to be MIPI 2nd port (port1).

MTXCLK1P/N and MIPI 2nd port available maximum speed is 1.2Gbps.

The MIPI clock frequency output from MTXCLK0 and MTXCLK1 is the same frequency. It is not possible to output a different frequency.

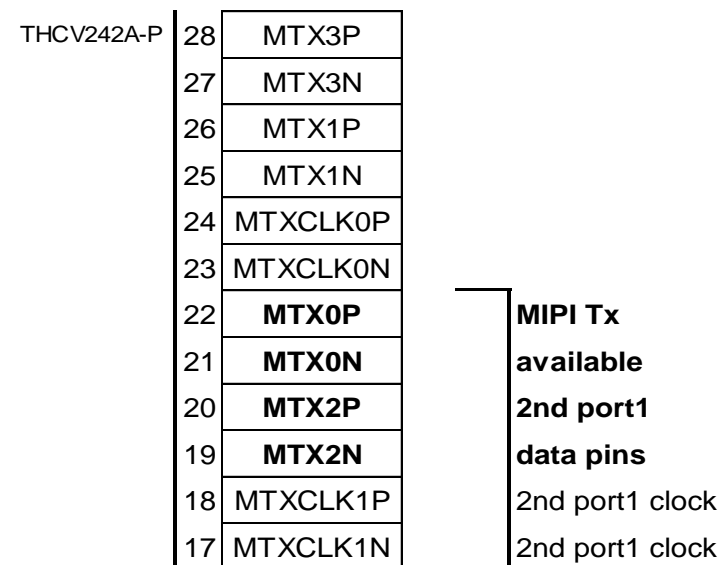

Figure 15. MIPI 2nd port available pins

Setting of MIPI 2port output examples are shown below.

Table 32. MIPI 2port output setting example

R_TX_LANE_SEL0				R_TX_LANE_SEL1				R_LANE_EN				R_REQ_SEL				MIPI Physical pin order output assignment					
lane3	lane2	lane1	lane0	port1 select		port enable	clk enable	config	lane3	lane2	lane1	lane0	lane3	lane1	lane0	lane2

other settings												forbidden									

6.5.4. MIPI CSI-2 Virtual Channel

MIPI Virtual Channel (VC) is supported. When MIPI PH (Packet Header) is intake from V-by-One® HS input, MIPI Virtual Channel information in PH is also bridged from V-by-One® HS at the same time. Virtual Channel information can be intake from Main-Link input and properly applied on MIPI Packet Header by selectable register setting.

6.5.5. MIPI Line Start/Line End code output setting

Both Line Start (LS) code and Line End (LE) code are optional code in MIPI CSI-2. When R_NONUSE_LSLE register is set 1'b1, both inputted LS and LE data are masked and ignored. On the other hands, when R_NONUSE_LSLE register is set 1'b0, both inputted LS and LE data are transmitted normally. For a system that do not use LS/LE code, R_NONUSE_LSLE_ register must be set 1'b1 to prevent unexpected behavior.

Table 33. MIPI Line Start and Line End code setting

Address	bit	Register Name	width	R/W	init	Description
0x1013	[7:1]	ReservedL	7	R/W	7'h00	must be left 0x00 (default setting)
	[0]	R_NONUSE_LSLE	1	R/W	1'h0	Line start and Line end code use or non-use setting for all Main-Link lane 0x0: When a system is used mipi line start and line end, must be set 0x0 (*) 0x1: When a system is not use mipi line start and line end, must be set 0x1 (*) When 0x1013[0] = 0x0, 0x1606[1:0] must be set 0x3.

6.5.6. Multiple camera synchronization Frame Vsync supply

Frame VSYNC can be supplied from THCV242A-P to Sub-Link Slave GPO.

EXTSYNC input or internally generated VSYNC become supply source. Settings are configurable by 2-wire access to internal register. When internal VSYNC is selected, generated VSYNC is not only sent to remote Sub-Link Slave but also output from EXTSYNC pin.

Internal VSYNC uses two clock source, internal oscillator clock and video pixel clock from Main-Link input. At the beginning of internal VSYNC generation operation, oscillator clock is used to supply VSYNC. After Main-Link video source is received stable, internal VSYNC generation source is switched to video pixel clock from selected Main-Link input. When Main-Link video pixel clock input is lost, internal VSYNC generator again uses internal oscillator clock until Main-Link video pixel clock input is regained.

6.6.3. Interrupt monitoring

Interrupt (INT1/0) detects occurrence of internal error or status signal and then, latch the detected state.

Interrupt factor can be cleared by particular register* write “1” access. (*They are indicated as “R_INTC_*”)

Interrupt factor can be masked to “0” fixed by particular register appropriate write access.

INT interrupt function is supposed to be cleared before start monitoring any desired status because INT status may change at power on condition and THCV242A-P internal boot up procedure.

Table 43. Interrupt monitoring

Register	Address	bit	Description
R_INTR_MLRX	0x1710/ 0x1718	7	Reserved

		4	Sub-Link protocol error for Lane0
		3	Reserved
		2	Reserved
		1	Data Stream Handler error2 for Lane1
		0	Data Stream Handler error2 for Lane0

As a register, interrupt detected state is “1” and cleared state is “0”. When multiple interrupt sources are activated, the OR operated result is indicated as IC external INT1/0 pin output.

As an external INT1/0 pin output, open drain output interrupt detected state is “Low” and cleared state is “Hi-Z”, while INT1/0 pin CMOS push-pull output interrupt detected state is “Low” and cleared state is “High”.

Table 44. INT1/0 pin output control

Address	bit	Register Name	width	R/W	init	Description
0x1006	[7:4]	R_INT1_MODE	4	R/W	4'h0	INT1 I/O Mode 0x0: Disable 0x1: OpenDrain Output Mode 0x2: Push/Pull Output Mode Other: Reserved
	[3:0]	R_INT0_MODE	4	R/W	4'h0	INT0 I/O Mode 0x0: Disable 0x1: OpenDrain Output Mode 0x2: Push/Pull Output Mode Other: Reserved

INT1/0 interrupt function is supposed to be cleared before start monitoring any desired status because INT1/0 status may have been changed before monitoring activation.

6.6.4. Register Auto Checksum diagnosis

Register values checksum is continuously calculated as R_CKSUM_RVAL.

Table 45. Register Auto Checksum diagnosis control and monitoring

Address	bit	Register Name	width	R/W	Init	Description
0x0008	[7:1]	reserved	7	-	-	-

6.7. Power On Sequence

Power On Sequence must be controlled appropriate.

For Power On Reset, PDN input must be low at the moment when VDDCORE (VDD12) reach operating condition voltage. As a note, PDN pin itself does not belongs to VDDCORE (VDD12) but to VDDIO1 (VDDH). PDN Power On Reset control is mandatory.

MIPI, PLL and V-by-One® HS block are reset state at power on default and require Reset Release.

V-by-One® HS Soft Reset / PLL Soft Reset => MIPI Soft Reset is proper. See below detail.

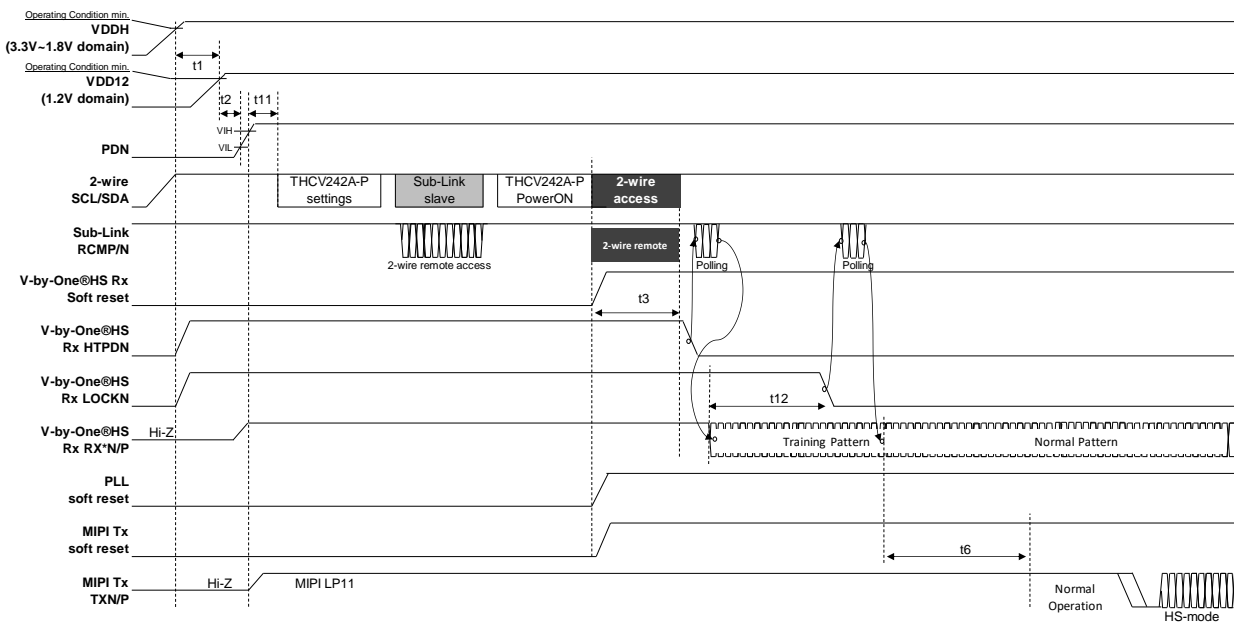

Figure 16. Power On Sequence procedure

Table 46. Power On Sequence specification

symbol	description	min.	typ.	max.	unit
t1	Required wait from VDDH assert to VDD12 assert	0	-	-	us
t2	Required wait from Power On to PDN High control	1000	-	-	us
t11	Required wait from PDN High to Register Access	300	-	-	us
t3	Time of V-by-One@HS Rx soft reset High to HTPDN Low	-	-	10	us
t12	Time of Training Pattern Input to LOCKN Low	-	-	980	us
t6	Time of V-by-One@HS Normal operation input to MIPI normal operation output	-	-	50+ 1frame	us

The first MIPI output from Power On waits vertical blanking period and starts output; therefore, MIPI normal operation may be hold for maximum 1frame, which depends on used video format.

6.8. Lock / Re-Lock Sequence

Lock and re-lock sequence are as follows. V-by-One® HS automatically shifts into lock status from initial status or unlock status caused by external noise under appropriate parameter set condition.

THCV242A-P LOCK Sequence

Figure 17. Lock Sequence

THCV242A-P Re-LOCK Sequence

Figure 18. Re-Lock Sequence

Table 47. Lock / Re-Lock Sequence specification

symbol	description	min.	typ.	max.	unit
t13	Time of LOCKN=H to MIPI Stand-by LP11 output	-	-	98	us
t6B	Time of V-by-One®HS Normal operation re-input to MIPI normal operation re-output	-	-	50	us

7. Absolute Maximum Ratings

CML Bi-directional buffer Output Voltage	-0.3	-	VDDIO2+0.3 *1	V
Output Current	-30	-	30	mA
Storage Temperature	-55	-	125	°C
Junction Temperature	-	-	125	°C
Reflow Peak Temperature/time	-	-	26	°C/sec
Maximum Power Dissipation @ +25°C	-	-	3.9	W

*1 Max. must be below 4V at the same time

*2 Max. must be below 1.6V at the same time

* “Absolute Maximum Ratings” are values of safety limit for a device beyond which a device safety cannot be guaranteed.

They do not imply that a device should be operated at these limits. The tables of “Recommended Operating Condition” specify conditions for device operation.

8. Recommended Operating Conditions

Table 49. Recommended Operating Conditions

Symbol	Parameter	Condition	min.	typ.	max.	Unit
VDDH	Supply Voltage (VDDIO1, VDDIO2)	-	1.7	-	3.6	V
VDD12	Supply Voltage 1.2V (VDDCORE, VDDRX, VDDTX, VDDPLL)	-	1.1	-	1.3	V
		1.2Gbps < fMIPI MTXCLK0P/N single clock out	1.15	1.25	1.3	V
Ta	Operating Ambient Temperature	-	-40	-	105	°C

9. Consumption Current

Table 50. Consumption Current at Power Down

symbol	parameter	condition	min.	typ.	max.	unit
ICCS33	Power Down Supply Current	PDN=0, VDDH=3.6V	-	0.1	-	mA
ICCS12		PDN=0, VDD12=1.3V	-	8	-	mA

Table 51. Consumption Current of VDDH

symbol	parameter	condition	min.	typ.	max.	unit
ICCW12_33_1	VDDIO1/2=3.3V	Sub-Link 1lane active	-	16	20	mA
ICCW12_33_2		Sub-Link 2lane active	-	32	38	mA
ICCW12_18_1	VDDIO1/2=1.8V	Sub-Link 1lane active	-	14	17	mA
ICCW12_18_2		Sub-Link 2lane active	-	27	32	mA

Table 52. Consumption Current of VDD12

Symbol	port.in#	port.out#	video format	input	output	min.	typ.	max.	Unit

11. AC Specifications

11.1. General AC Specifications

Table 57. General AC Specifications

symbol	parameter	condition	min.	typ.	max.	unit
tDL	Data Latency	MainLink 1Gbps, 0x1502 - 0x1505 registers are set default value.	typ.-98	16,000	typ.+98	ns

11.2. CML Receiver AC Specifications

Table 58. CML Receiver AC Specifications

symbol	parameter	condition	min.	typ.	max.	unit
tRBIT	Unit Interval	-	250	-	2500	ps
fRBIT		-	0.4	-	4	Gbps

11.3. CML B-directional Buffer AC Specifications

Table 59. CML B-directional Buffer AC Specifications

symbol	parameter	condition	min.	typ.	max.	unit
tBUI	Bi-Directional CML Buffer Unit Interval	-	128.7	137.5	172.7	ns

11.4. 2-wire serial Slave AC Specifications

Table 60. 2-wire serial Slave AC Specifications

symbol	parameter	condition	min.	typ.	max.	unit
tOSC	Cycle of internal oscillator clock	-	11.7	12.5	15.7	ns
fSCL	SCL clock frequency	-	-	-	1000	kHz
tHD;STA	Hold time (repeated) START condition	-	0.26	-	-	us
tLOW	LOW period of the SCL clock	-	0.5	-	-	us
tHIGH	HIGH period of the SCL clock	-	0.26	-	-	us
tSU;STA	Set-up time for a repeated START condition	-	0.26	-	-	us
tHD;DAT	Data hold time: output	-	0	2*tOSC	-	us
	Data hold time: input	-	0	-	-	ns
tSU;DAT	Data setup time: output	-	50	-	-	ns
	Data setup time: input	-	50	-	-	ns
tr	Rise time of both SDA and SCL signals	-	-	-	120(*1)	ns
tf	Fall time of both SDA and SCL signals	pull-up:2.5kΩ, bus capacitance : 400pF	-	-	120	ns
tSU;STO	Setup time for STOP condition	-	0.26	-	-	ns
tBUF	Bus free time between a STOP and START condition	-	0.5	-	-	us
tSP	Pulse width of spikes which must be suppressed by the input filter	-	-	-	50	ns
tPDS	Required wait time from PDN0 high to START condition	-	300	-	-	us

*1 Please adjust Pull-up resistor and bus capacitance to meet the spec value.

11.5. MIPI Transmitter AC Specifications

Table 61. MIPI Transmitter AC Specifications

symbol	parameter	condition	min.	typ.	max.	unit
tTBIT	Tx Unit Interval	-	0.833	-	12.5	ns
tTBIT		-	80	-	1200	Mbps
tTBIT		1.15V < VDD12	0.667	-	0.833	ns
tTBIT		MTXCLK0P/N single clockout	1200	-	1500	Mbps
tCLK-POST	Time that the transmitter continues to send HS clock after the last associated Data Lanes has transitioned to LP Mode.	tTBIT = 1200Mbps R_TX_CLK_POST* = 0x0F tTBIT = 600Mbps R_TX_CLK_POST* = 0x0A	60+52*tTBIT	-	-	ns
tCLK-PRE	Time that the HS clock shall be driven by the transmitter prior to any associated Data Lane beginning the transition from LP to HS mode.	tTBIT = 1200Mbps	8	-	-	tTBIT
		tTBIT = 600Mbps	4	-	-	
tCLK-PREPARE	Time that the transmitter drives the Clock Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission.	tTBIT = 1200Mbps R_TX_CLK_PREPARE* = 0x06	38	-	95	ns
		tTBIT = 600Mbps R_TX_CLK_PREPARE* = 0x03				
tCLK-TRAIL	Time that the transmitter drives the HS-0 state after the last payload clock bit of a HS transmission burst.	tTBIT = 1200Mbps R_TX_CLK_TRAIL* = 0x0C tTBIT = 600Mbps R_TX_CLK_TRAIL* = 0x07	60	-	-	ns
tCLK-PREPARE + tCLK-ZERO	tCLK-PREPARE + Time that the transmitter drives the HS-0 state prior starting the Clock.	tTBIT = 1200Mbps R_TX_CLK_PREPARE* = 0x06 R_TX_CLK_ZERO* = 0x29 tTBIT = 600Mbps R_TX_CLK_PREPARE* = 0x03 R_TX_CLK_ZERO* = 0x13	300	-	-	ns
tEOT	Transmitted time interval from the start of tHS-TRAIL or tCLK-TRAIL, to the start of the LP-11 state following a HS burst.	tTBIT = 1200Mbps R_TX_CLK_TRAIL* = 0x0C R_TX_THS_TRAIL* = 0x0C tTBIT = 600Mbps R_TX_CLK_TRAIL* = 0x07 R_TX_THS_TRAIL* = 0x07	-	-	105+12*tTBIT	ns
tHS-EXIT	Time that the transmitter drives LP-11 following a HS burst.	tTBIT = 1200Mbps R_TX_THS_EXIT* = 0x04 tTBIT = 600Mbps R_TX_THS_EXIT* = 0x00	100	-	-	ns
tHS-PREPARE	Time that the transmitter drives the Data Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission.	tTBIT = 1200Mbps R_TX_THS_PREPARE* = 0x06 tTBIT = 600Mbps R_TX_THS_PREPARE* = 0x03	40+4*tTBIT	-	85+6*tTBIT	ns
tHS-PREPARE + tHS-ZERO	tHS-PREPARE + Time that the transmitter drives the HS-0 state prior to transmitting the Sync sequence.	tTBIT = 1200Mbps R_TX_THS_PREPARE* = 0x06 R_TX_THS_ZERO* = 0x10 tTBIT = 600Mbps R_TX_THS_PREPARE* = 0x03 R_TX_THS_ZERO* = 0x06	145+10*tTBIT	-	-	ns
tHS-TRAIL	Time that the transmitter drives the flipped differential state after last payload data bit of a HS transmission burst.	tTBIT = 1200Mbps R_TX_THS_TRAIL* = 0x0C tTBIT = 600Mbps R_TX_THS_TRAIL* = 0x07	60+4*tTBIT	-	-	ns
tLPX	Transmitted length of any Low-Power state period.	tTBIT = 1200Mbps R_TX_TLPX* = 0x08 tTBIT = 600Mbps R_TX_TLPX* = 0x04	50	-	-	ns

13. Notices and Requests

1. The product specifications described in this material are subject to change without prior notice.
2. The circuit diagrams described in this material are examples of the application which may not always apply to the customer's design. THine Electronics, Inc. ("THine") is not responsible for possible errors and omissions in this material. Please note even if errors or omissions should be found in this material, THine may not be able to correct them immediately.
3. This material contains THine's copyright, know-how or other proprietary. Copying or disclosing to third parties the contents of this material without THine's prior permission is prohibited.
4. Note that even if infringement of any third party's industrial ownership should occur by using this product, THine will be exempted from the responsibility unless it directly relates to the production process or functions of the product.
5. Product Application
 - 5.1 Application of this product is intended for and limited to the following applications: audio-video device, office automation device, communication device, consumer electronics, smartphone, feature phone, and amusement machine device. This product must not be used for applications that require extremely high-reliability/safety such as aerospace device, traffic device, transportation device, nuclear power control device, combustion chamber device, medical device related to critical care, or any kind of safety device.
 - 5.2 This product is not intended to be used as an automotive part, unless the product is specified as a product conforming to the demands and specifications of IATF16949 ("the Specified Product") in this data sheet. THine accepts no liability whatsoever for any product other than the Specified Product for it not conforming to the aforementioned demands and specifications.
 - 5.3 THine accepts liability for demands and specifications of the Specified Product only to the extent that the user and THine have been previously and explicitly agreed to each other.
6. Despite our utmost efforts to improve the quality and reliability of the product, faults will occur with a certain small probability, which is inevitable to a semi-conductor product. Therefore, you are encouraged to have sufficiently redundant or error preventive design applied to the use of the product so as not to have our product cause any social or public damage.
7. Please note that this product is not designed to be radiation-proof.
8. Testing and other quality control techniques are used to this product to the extent THine deems necessary to support warranty for performance of this product. Except where mandated by applicable law or deemed necessary by THine based on the user's request, testing of all functions and performance of the product is not necessarily performed.
9. Customers are asked, if required, to judge by themselves if this product falls under the category of strategic goods under the Foreign Exchange and Foreign Trade Act.
10. The product or peripheral parts may be damaged by a surge in voltage over the absolute maximum ratings or malfunction, if pins of the product are shorted by such as foreign substance. The damages may cause a smoking and ignition. Therefore, you are encouraged to implement safety measures by adding protection devices, such as fuses.
