Description

Diodes' PI2EQX638 is a low power, high performance 5.0 Gbps 2-Port USB3.0 Mux / DeMux ReDriver™ designed specifically for the USB 3.0 protocol.

The device provides programmable equalization, swing and De-Emphasis to optimize performance over a variety of physical mediums by reducing Inter-Symbol Interference. PI2EQX638 supports two 100Ω Differential CML data I/O's between the Protocol ASIC to a switch fabric, over cable, or to extend the signals across other distant data pathways on the user's platform.

The integrated equalization circuitry provides flexibility with signal integrity of the signal before the ReDriver. A low-level input signal detection and output squelch function is provided for each channel. Each channel operates fully independently. The channels' input signal level (on xI+/-) determines whether the output is active.

The PI2EQX638 also includes an adaptive power management feature to maximize battery life for power sensitive consumer devices.

Power Management

PI2EQX638 USB3.0 Active Switch includes an adaptive power management feature to support long battery run-time ideal for power-sensitive Smart Mobile Devices. PI2EQX638 is equipped with two differential paths, one is from application processor side to type-C connector side and the other is from type-C connector side to application processor side. Each path has 4 power modes: active mode, slumber mode, deep slumber mode and unplug mode. These power modes are managed by the adaptive power management feature according to the link status. The feature does not decode the USB3.x power management commands to obtain the link status, it relies on link electrical condition, internal timer and internal state machine. Hence, the feature can optimize the power saving in U1 (slumber mode), U2/U3 (deep slumber mode) and no connection state (Either no device is connected to the type-C connector or the receiver terminal of the connected device is in high impedance mode).
