Solder Process Recommendations:	RoHS compliant, lead free. See solder profile on page 4.
In-line oven profile:	We recommend using KIC profiler or similar device placing one of the thermocouples on the device to insure that the package temperature does not exceed 235°C for more than 20 seconds.
Removal of device:	If for any reason the device needs to be removed from the board, use a temperature controlled repair station with profile monitoring capabilities. Following a monitored profile will insure the device is properly pre-heated prior to reflow. Refer to IPC 610E for inspection guidelines.

Recommended Cleaning Process: (If required)	Device is non-hermetic, water resistance with four weep holes, one in each corner to allow moisture to be removed during the drying cycle. We recommend in-line warm water wash with air knife and drying capabilities. If cleaner does not have drying capability, then use hot air circulated oven. Boards should be placed in the oven vertically for good water runoff
---	--

Device must be dried properly prior to use!

Note: If saponifier is used make sure the device is rinsed properly to insure all residues are removed. PH of saponifier should not exceed 10.

Drying Temperature:	Between 85 to 100°C.
Drying Time:	Time will vary depending on the board size.

Caution: Do not submerge the device!

Notes:

1. Frequency stability vs. change in temperature. $[\pm(F_{max} - F_{min})/(2 \cdot F_0)]$.
2. Initial calibration @ 25°C. For OCXO with EFT, the control voltage must be fixed.
3. After 30 days of operation.
4. Inclusive of calibration @ 25°C, frequency vs. change in temperature, change in supply voltage ($\pm 5\%$), load change ($\pm 5\%$), shock and vibration and 20 years aging.
5. Minimum "Power On Time" after rail rises from 0 to within $\pm 5\%$ of $V_{cc} = 1$ second. Supply voltage must reach V_{cc} level monotonically.
6. 10ms start time is guaranteed when supply voltage reaches V_{cc} level in $\leq 500\mu s$. If supply ramp is greater than 500us, then start times as long as 1s are possible.
7. Attention: To achieve optimal frequency stability, and in some cases to meet the specification stated on this data sheet, it is required that the circuit connected to this OCXO output must have the equivalent input capacitance that is specified by the nominal load capacitance. Loads higher than the nominal value will have a graduated effect on the stability of approximately 20ppb per pf of load difference.
8. Positive slope (frequency increases as V_c voltage increases). To ensure proper operation of VCOCXO's, the control voltage input must be biased to the nominal control voltage. Failure to bias the V_c input may result in an unstable output condition.
9. Referenced to F_0 .
